

# *Fundamentals of Astronomy*

**Prof Wladimir Lyra**

Astronomy building, 202A

Office Hours: Tue 2pm - 3pm

Class hours: Tue/Thu 10:30am - 11:45am

Cume # 213  
Bernard McNamara

2. The Hyades cluster is located at  $\alpha = 4^{\text{h}} 32^{\text{m}}$   $\delta = +16^{\circ}$ . When would this cluster be most suitable for ground based observation.

## Positional Astronomy

# Positional Astronomy

## Learning Objectives

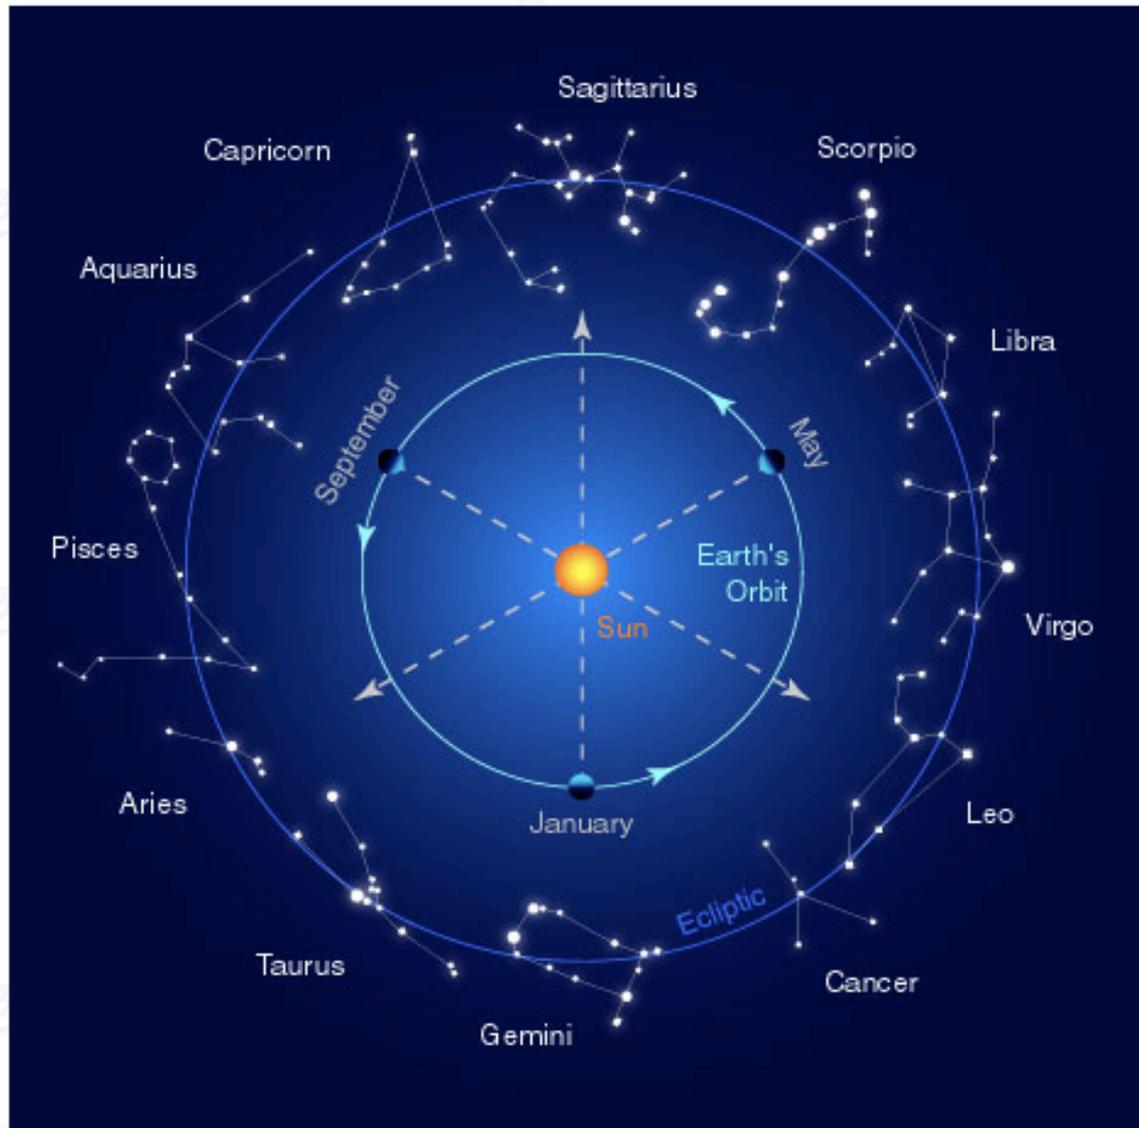

- Familiarity with circles and angles on the Celestial Sphere
  - RA/Dec, coordinates
  - Spherical trigonometry
    - Astronomical time

### **Class 1**

- Celestial Sphere
- Equatorial, horizontal and ecliptic coordinates

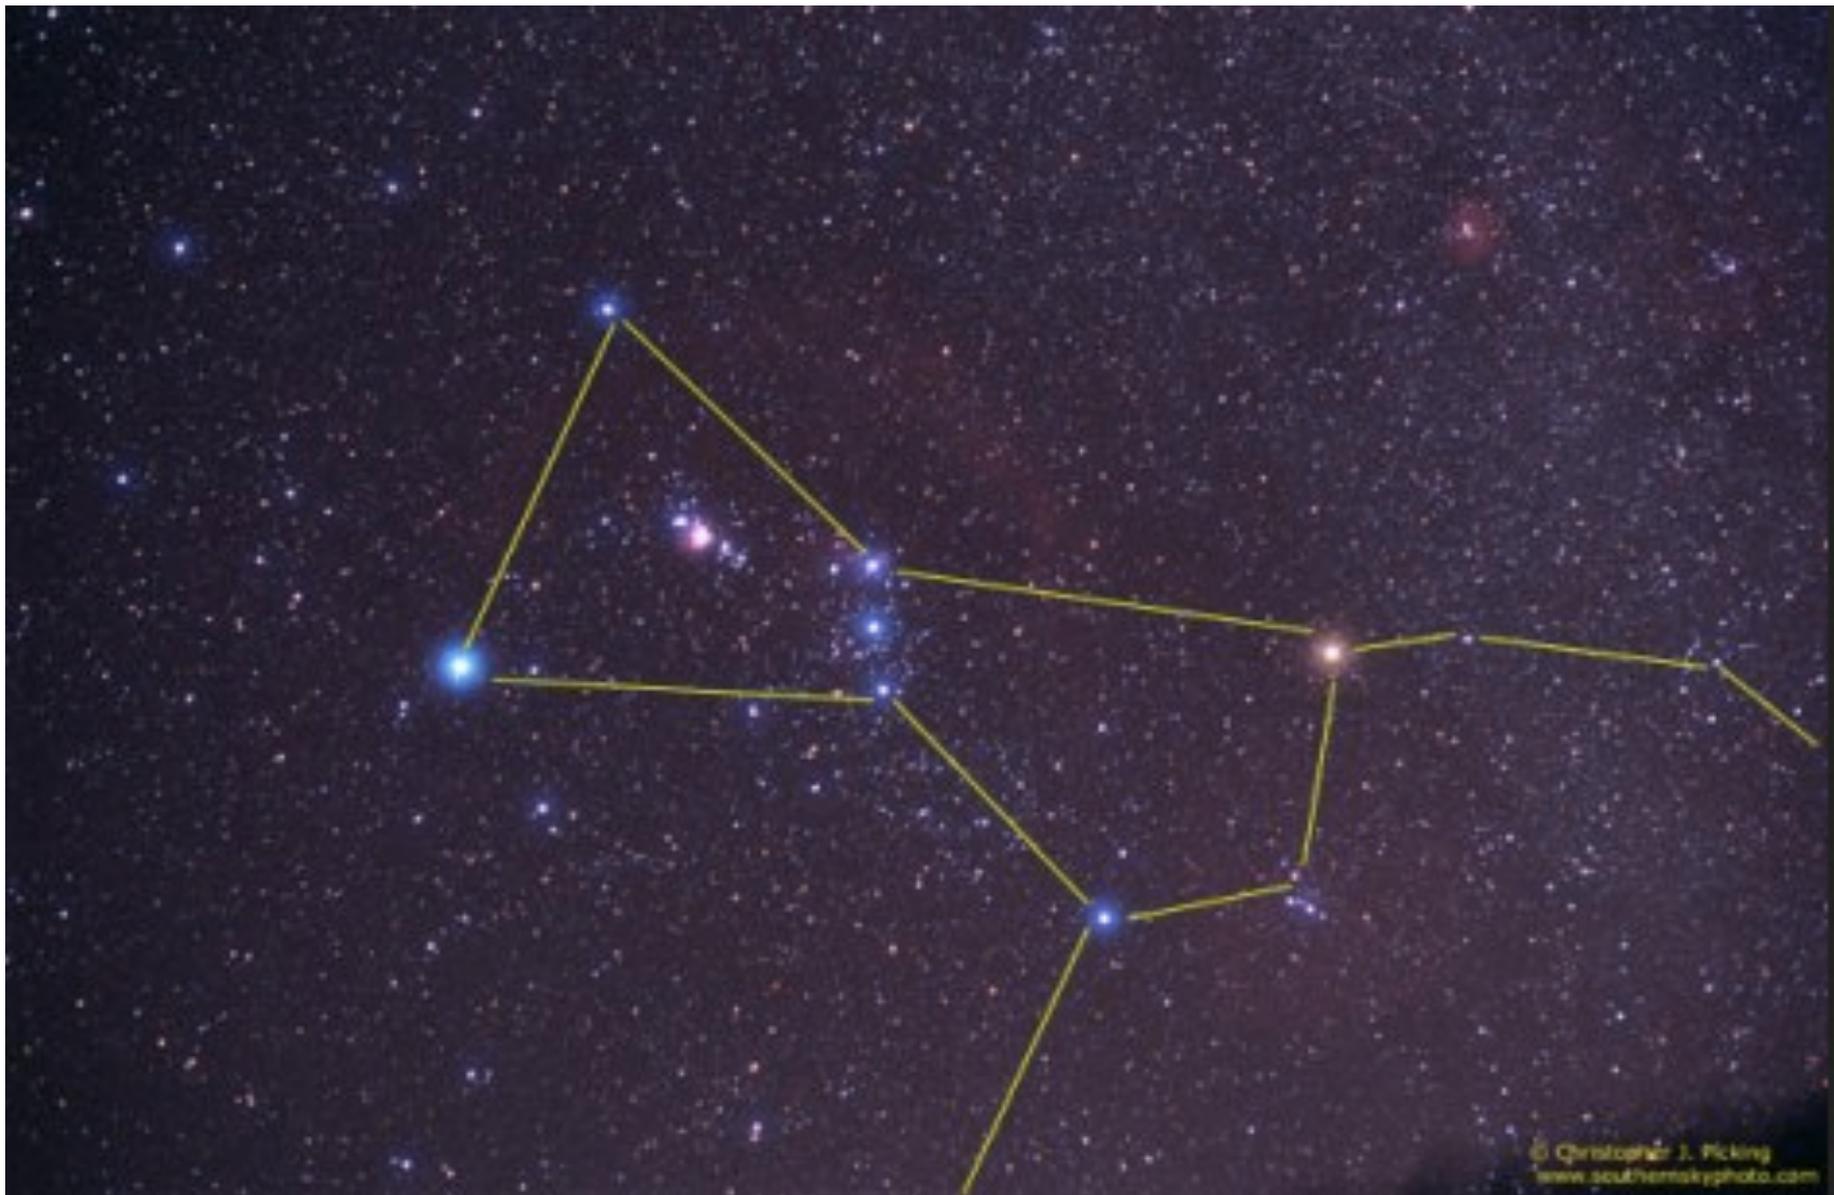

### **Class 2**

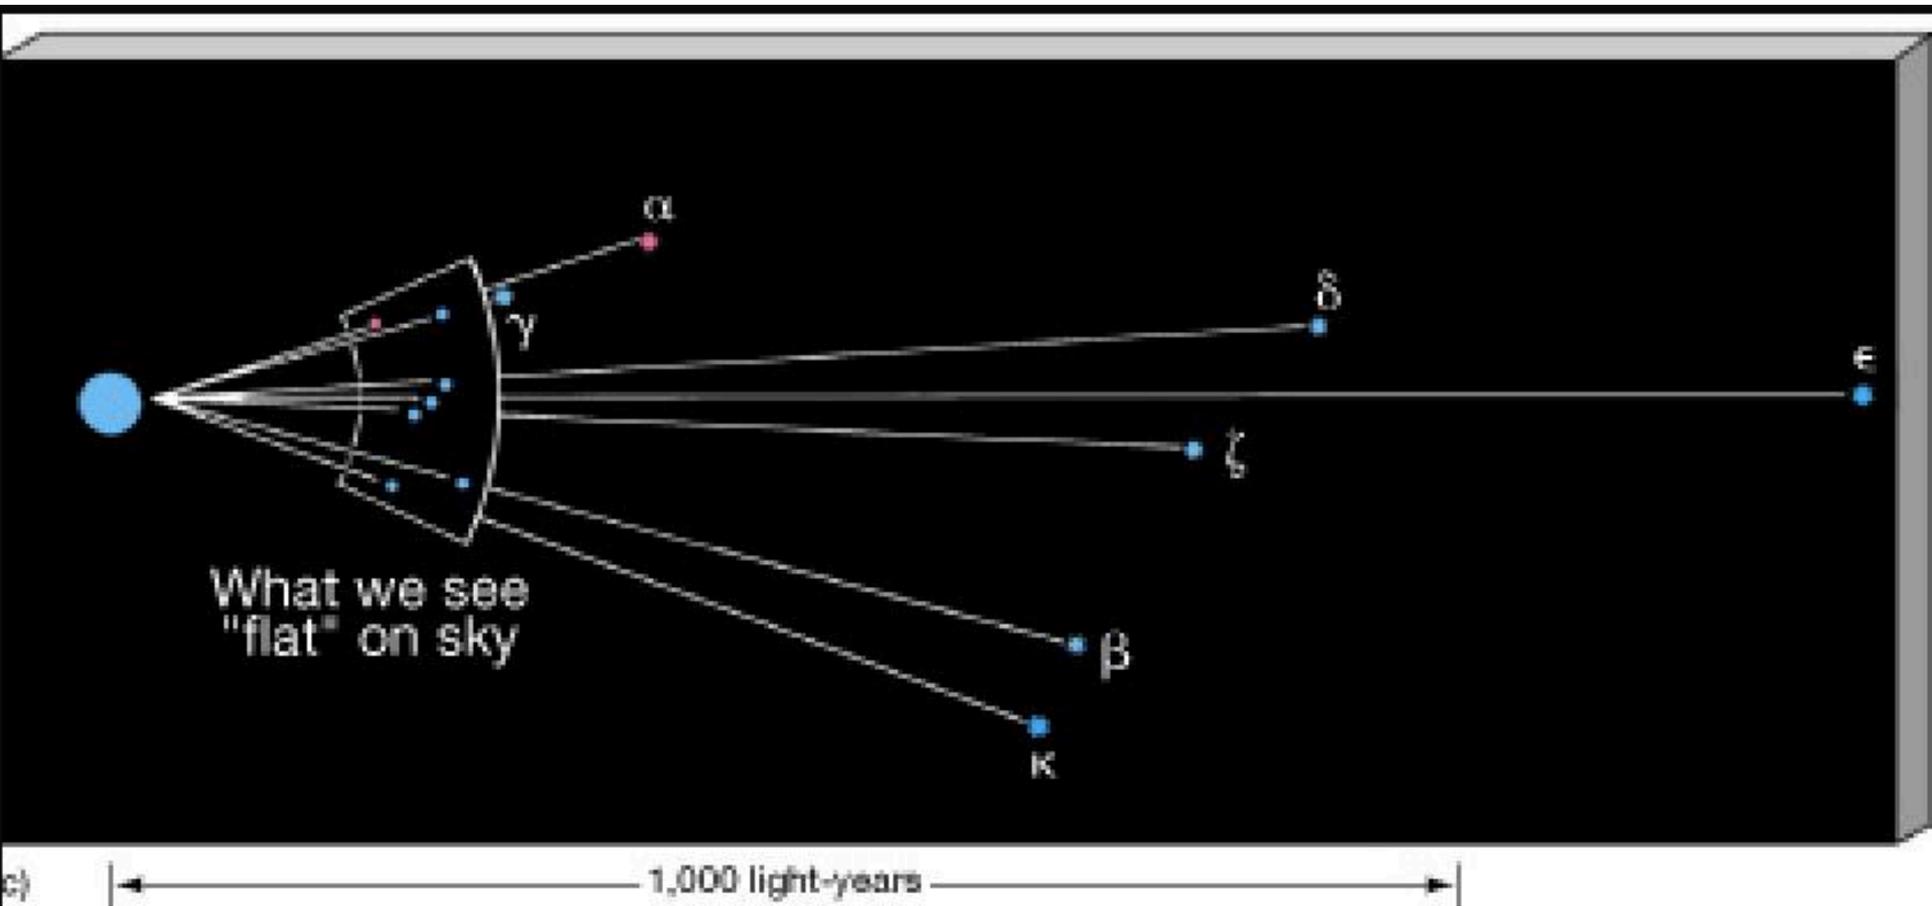

- Hour coordinates
  - Time
- Galactic coordinates
- coordinate transformation by spherical trigonometry.

# Loss of perception of depth

c)

# Distances to the stars of Orion

Orion might look like a flat blanket of stars, but its components are spread over hundreds of light years

## Betelgeuse

Betelgeuse is a red supergiant that could explode as a supernova any day now, and is about 640 light years away.

## Orion nebula

The nebula forms the fuzzy tip of the 'sword' hanging from Orion's belt of three stars. It is a giant cloud of gas forming new stars and is 1,344 light years away.

## Saiph

At the lower-left 'knee' of Orion, Saiph is 650 light years away. It is a large star that, like Betelgeuse and Rigel, will one day blow up in a supernova.

## Bellatrix

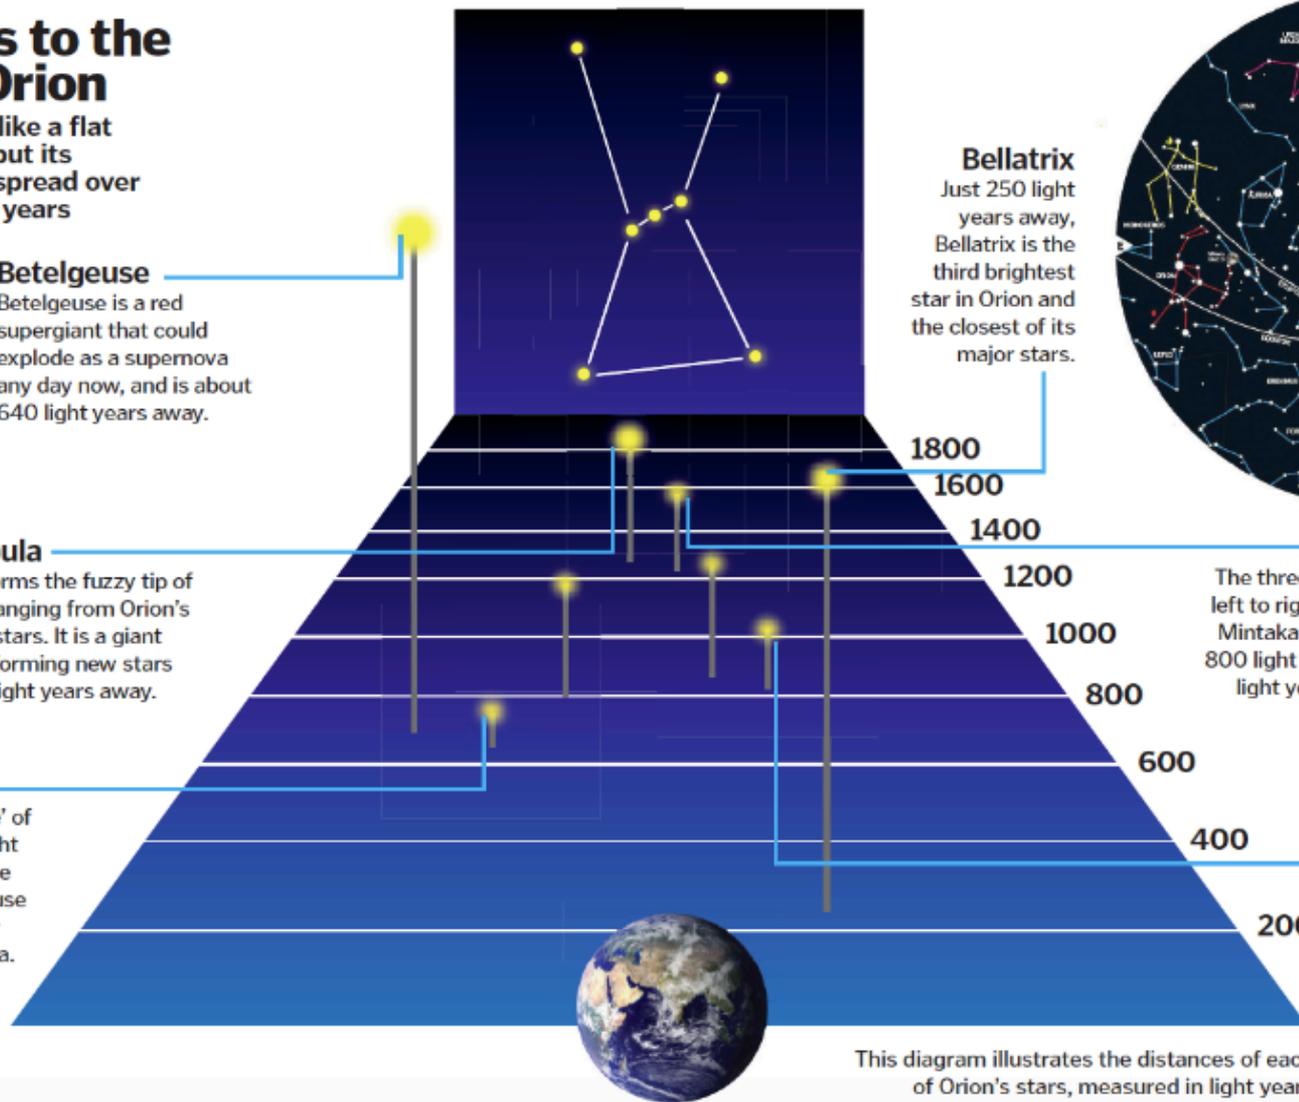

Just 250 light years away, Bellatrix is the third brightest star in Orion and the closest of its major stars.

## Orion's Belt

The three stars in Orion's Belt, from left to right, are Alnitak, Alnilam and Mintaka. Estimates place Alnitak at 800 light years away, Mintaka 1,300 light years away and Alnilam 900 light years away.

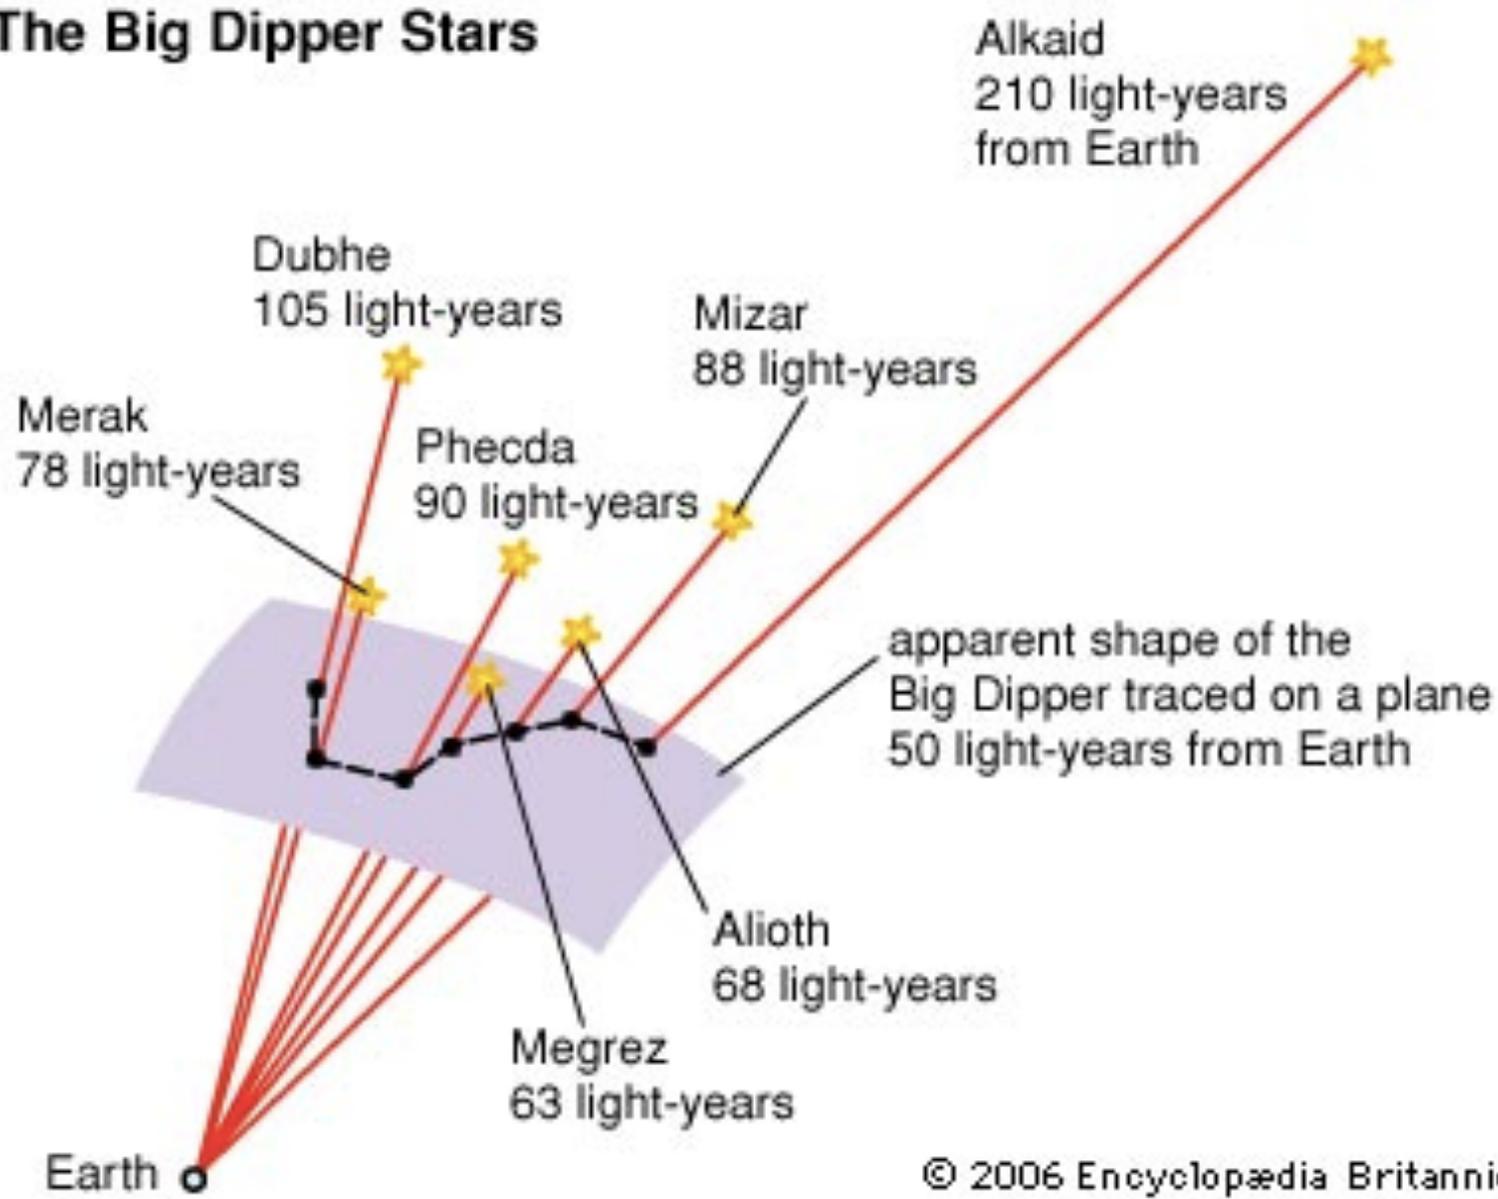

## Rigel

The brightest star in Orion is Rigel, a white supergiant, about 860 light years away.

This diagram illustrates the distances of each of Orion's stars, measured in light years

N.M.S.U. Astronomy Department: Cumulative Exam #368  
18<sup>th</sup> February 2012 – Nicole Vogt

Please start a new page for each problem, and when you are done staple the pages together in order. Keep your work clear and organized, state all assumptions, and show your work. You may use your calculators only as simple calculating machines (do not access constants other than  $\pi$  and  $e$ , and do not access stored formulas).

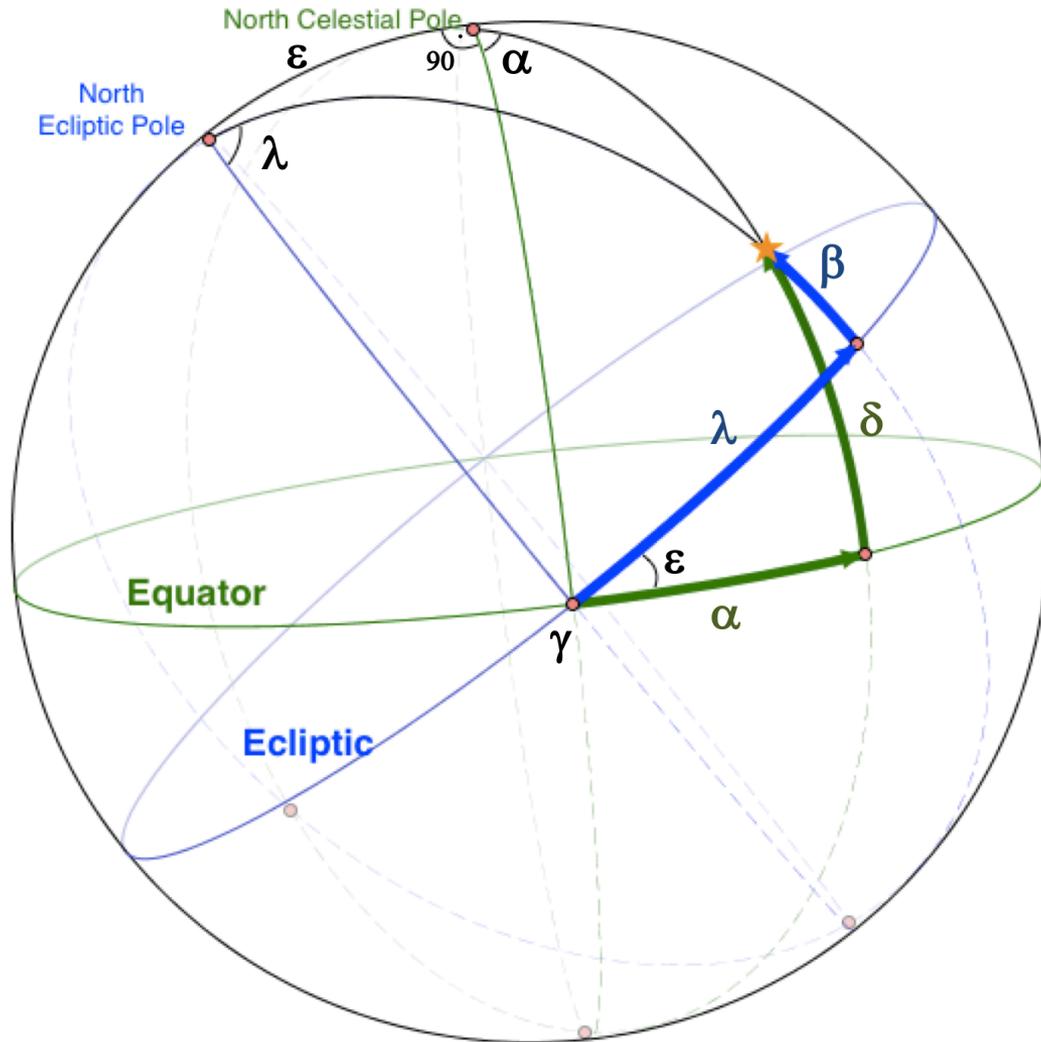

The exam comprises 100 points. I anticipate a passing score for papers marked above 80%.

1. The Canaries Great Telescope is located on the island of La Palma, with a longitude of  $18^\circ\text{W}$  and a latitude of  $28^\circ\text{N}$ .
  - (a) If while observing you notice the third quarter Moon transiting at the zenith, what is the month, approximate day of the month, and time of day? (10 pts)
  - (b) Could you observe the Galactic Center during your observing run? If so, at what time, and where would it lie in the sky? Would moonlight be an issue? (10 pts)

# Equatorial and Ecliptic

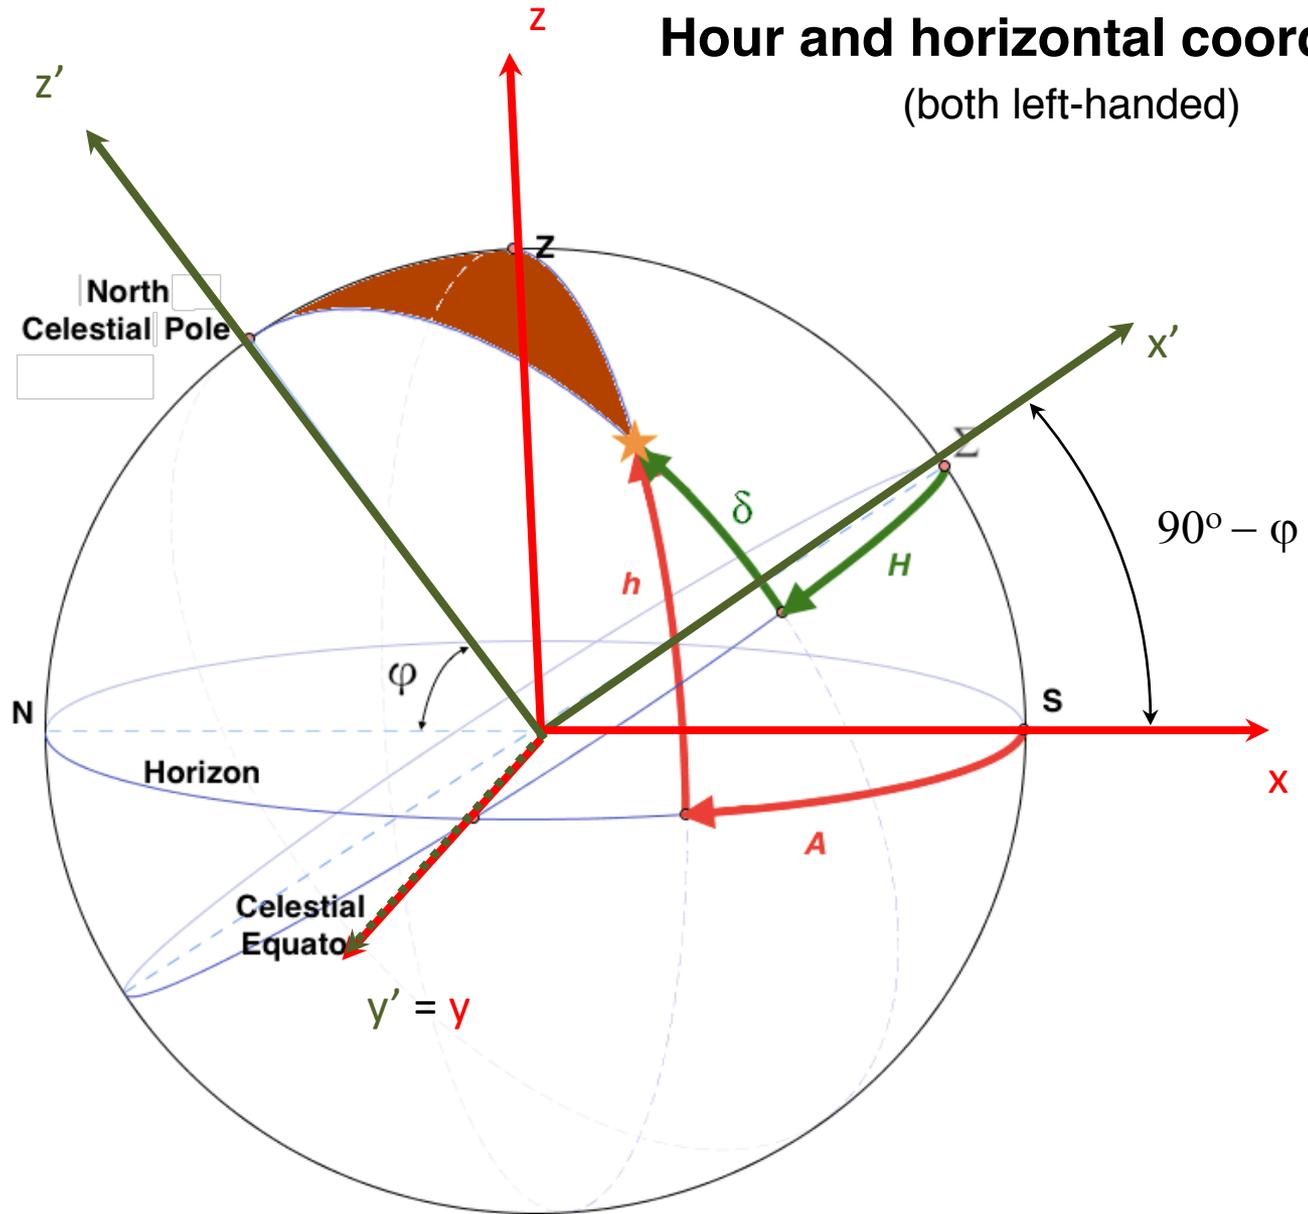

## Right-handed coordinates ( $\mathbf{x} \times \mathbf{y} = \mathbf{z}$ )

## Left-handed coordinates ( $\mathbf{y} \times \mathbf{x} = \mathbf{z}$ )

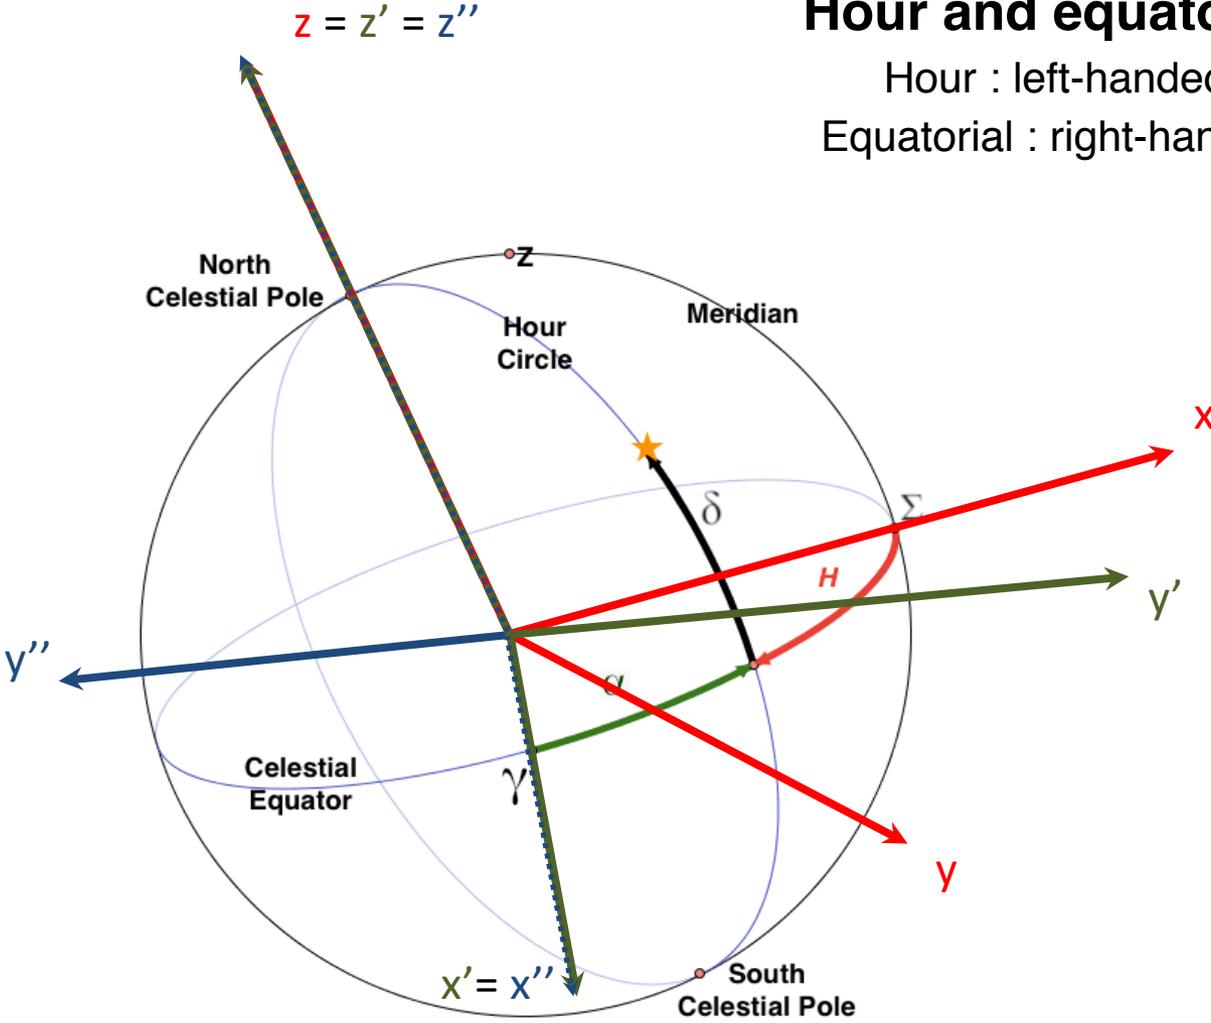

# Hour and horizontal coordinates (both left-handed)

# Hour and equatorial

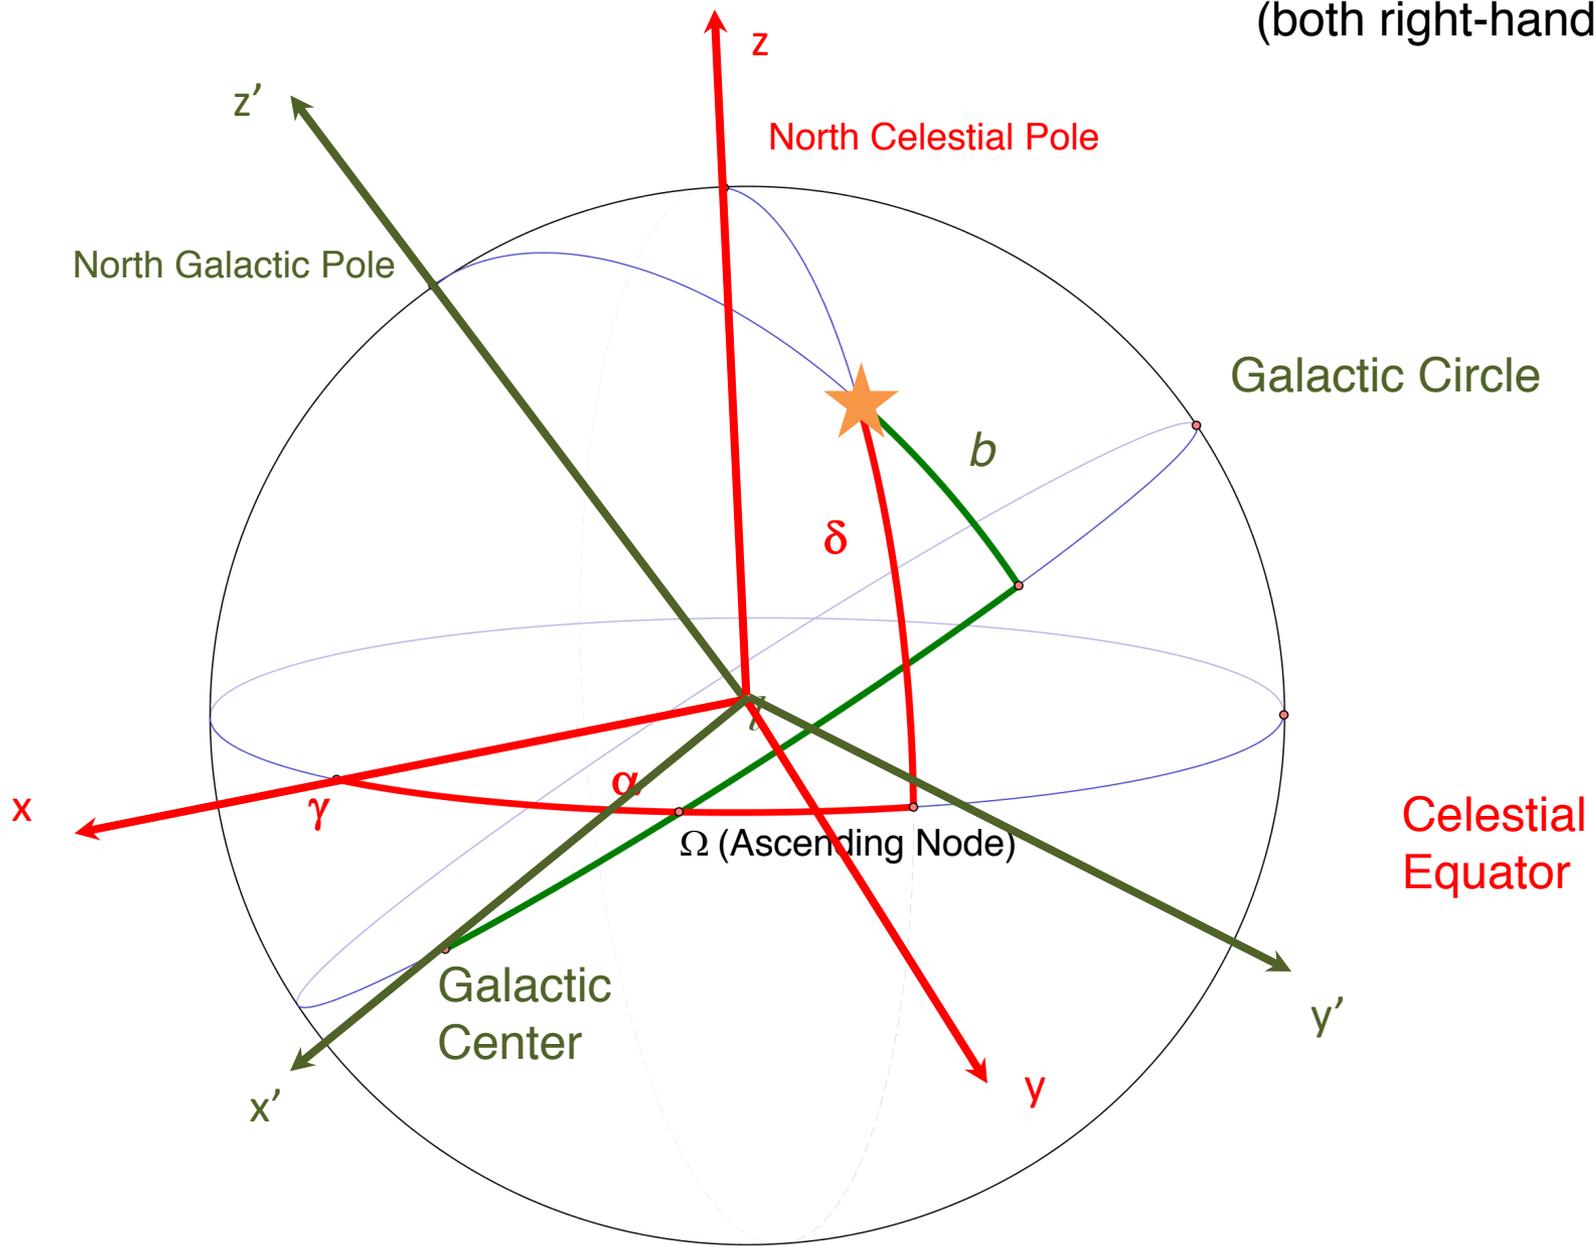

Hour : left-handed

Equatorial : right-handed

# Equatorial to Galactic

(both right-handed)

# Lunar Parallax

For very close objects, their position relative to the stars will change depending on the position of the observer.

Montreal, Quebec, Canada  
Latitude 45.5000N, Longitude 73.5830W

Selsey, West Sussex, United Kingdom  
Latitude 50.7340N, Longitude 0.7680W

Montevideo, Uruguay, South America  
Latitude 34.9167S, Longitude 56.1667W

Image: Visible Earth, NASA

This image is a composite of three images of an eclipsed Moon taken at the same time (03h30m ±11s UTC) from three distant locations on the Earth - Montreal - Quebec - Canada, Montevideo - Uruguay - South America and Selsey - West Sussex - UK.

The Moon being ~400,000km distant shows a 'parallax-shift' when the three images are superimposed in this manner. The surface (great-circle) distance between the imaging sites is:  
A-B: 5,220km, A-C: 9,121km, B-C: 10,967km

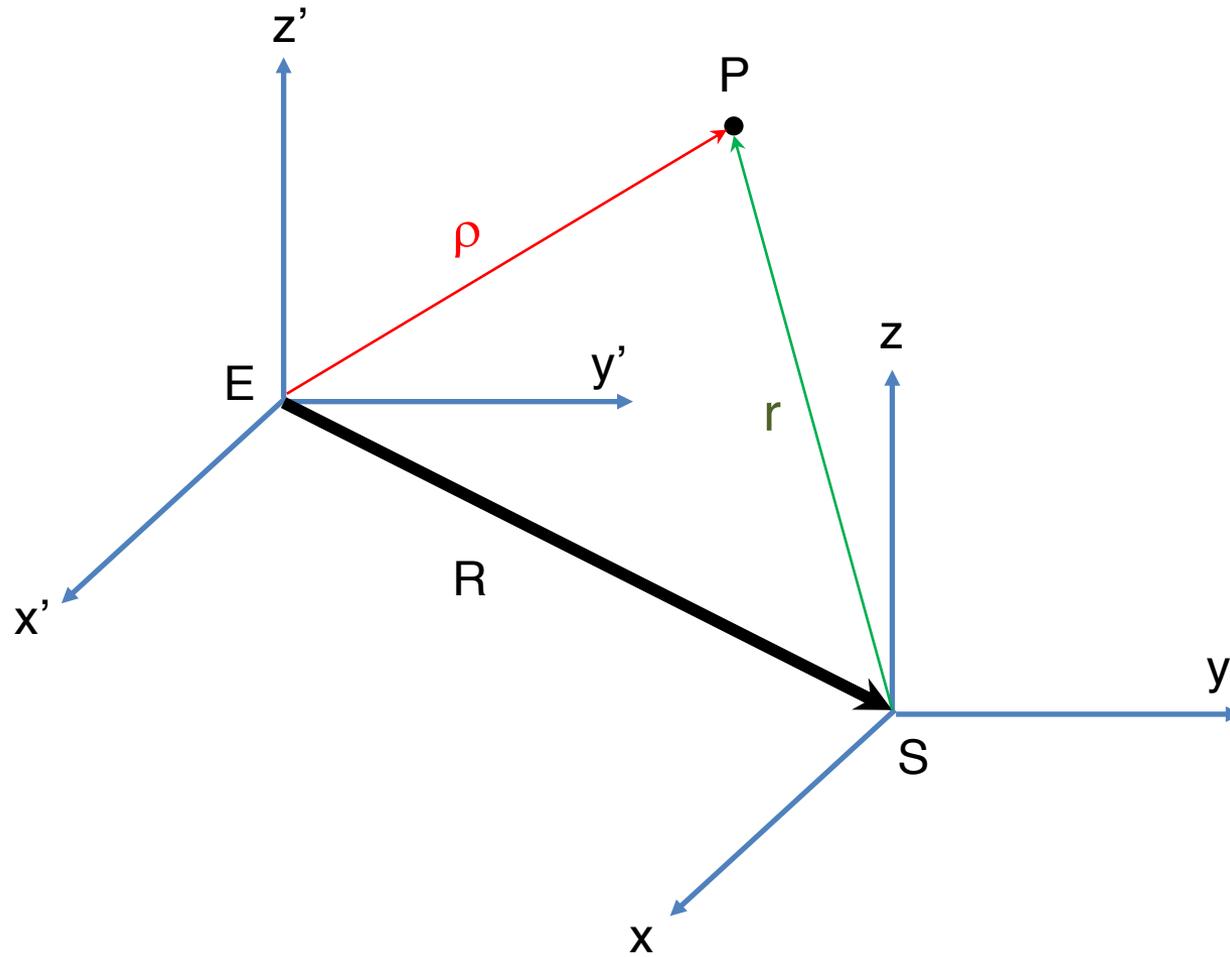

*Peter Cleary, Montreal, Canada*  
*Gerardo Addiego, Montevideo, Uruguay, South America*
