

Kepler's Laws

Learning Objectives

- Emergence of modern astronomy
 - Planetary motion
- The interplay between theory and observation
- The fundamental importance of observational accuracy

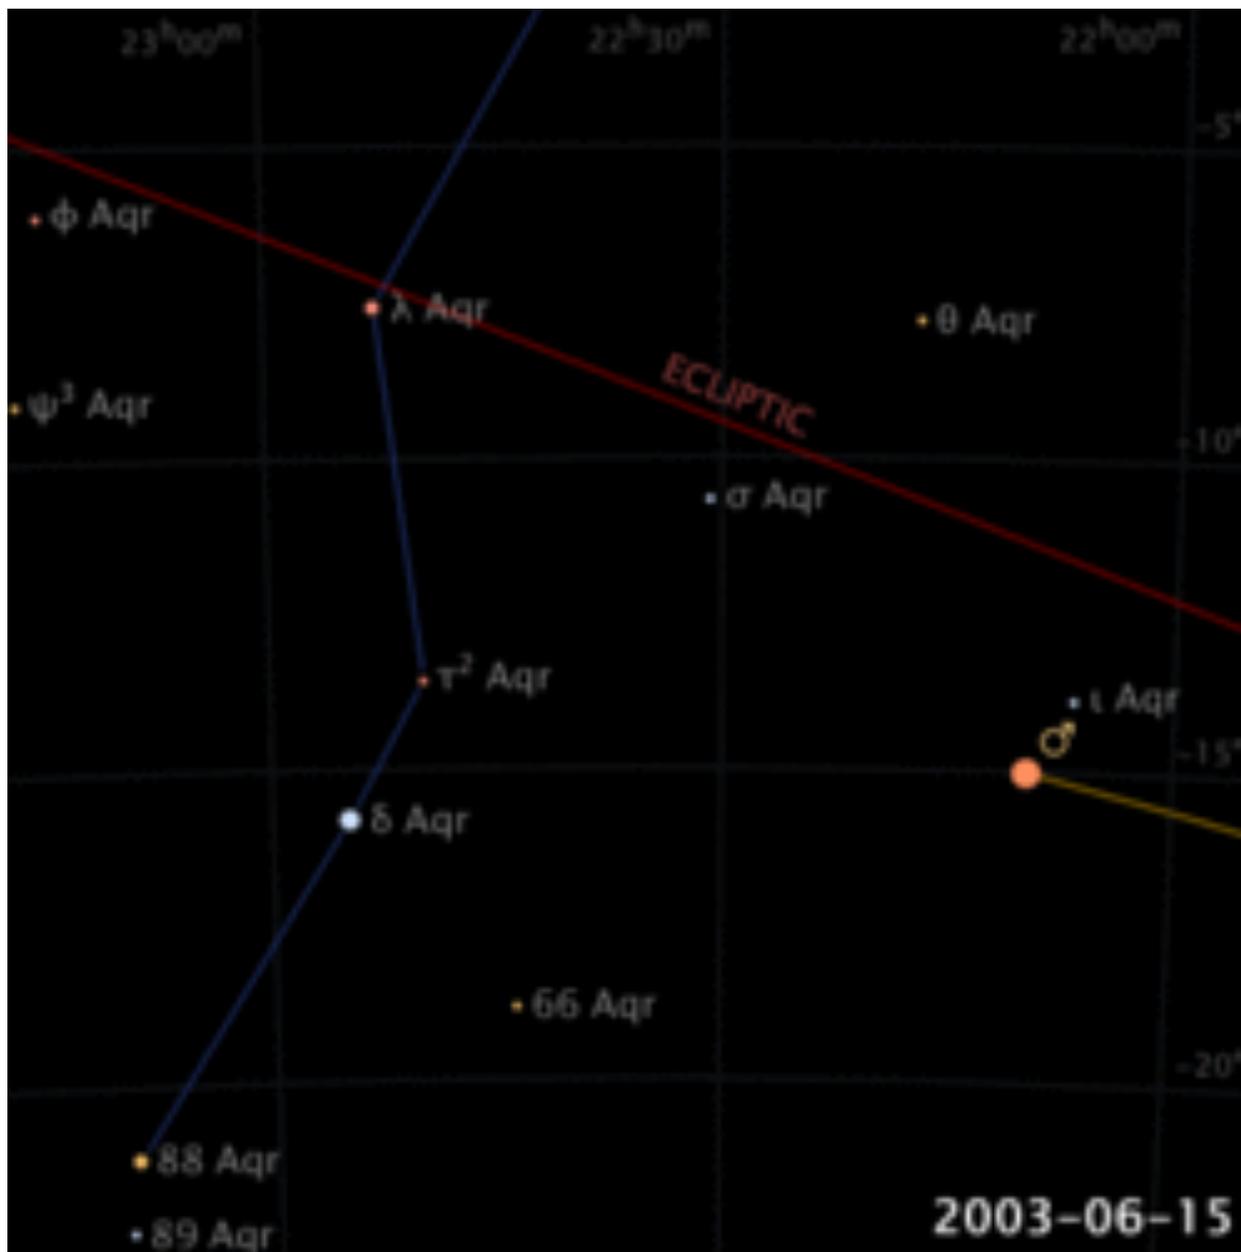

Elongation

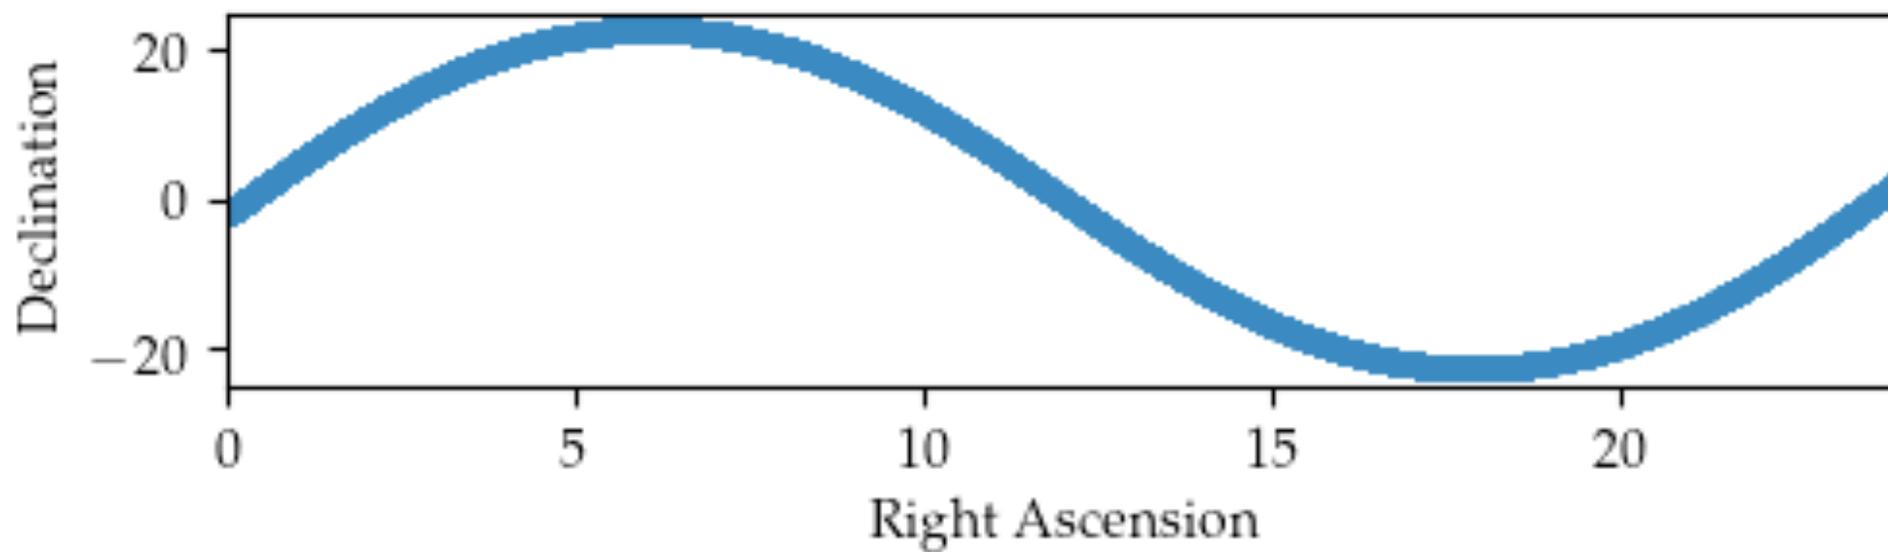

angle between a Planet and the Sun

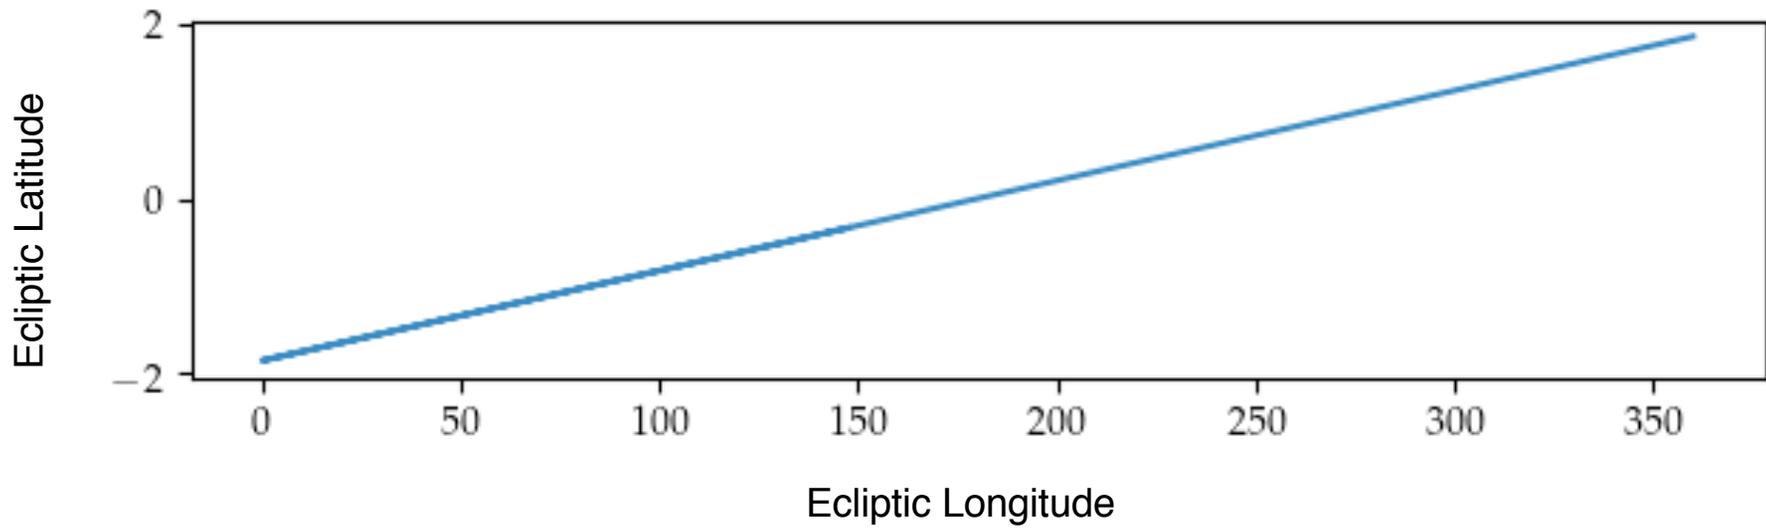

Path of Mars

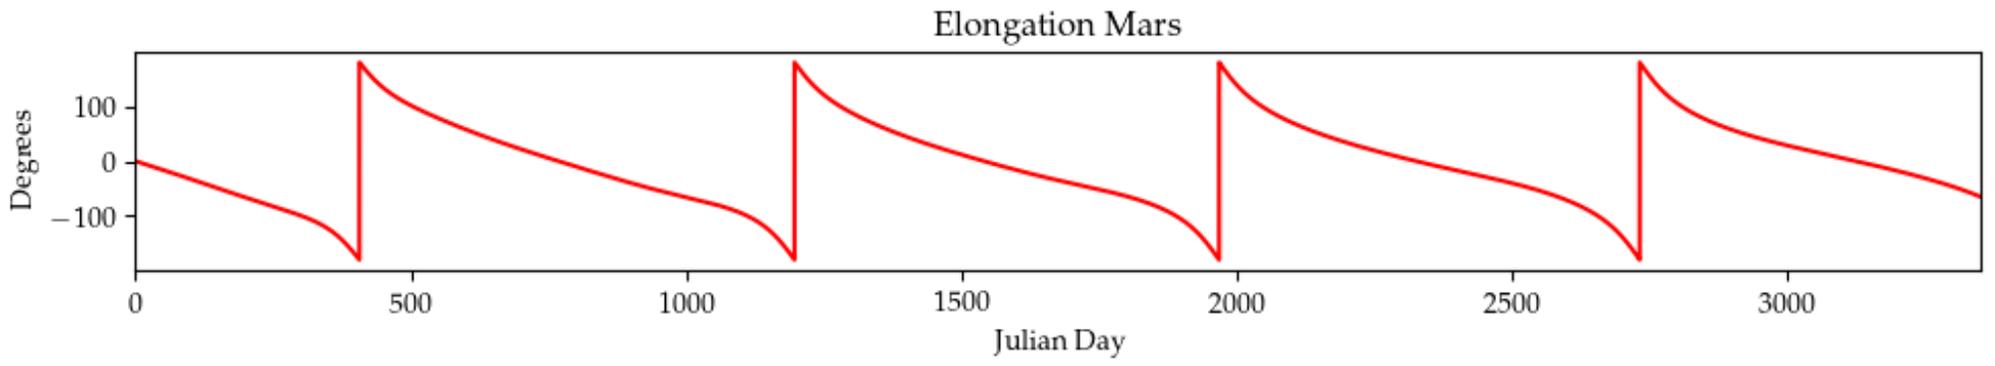

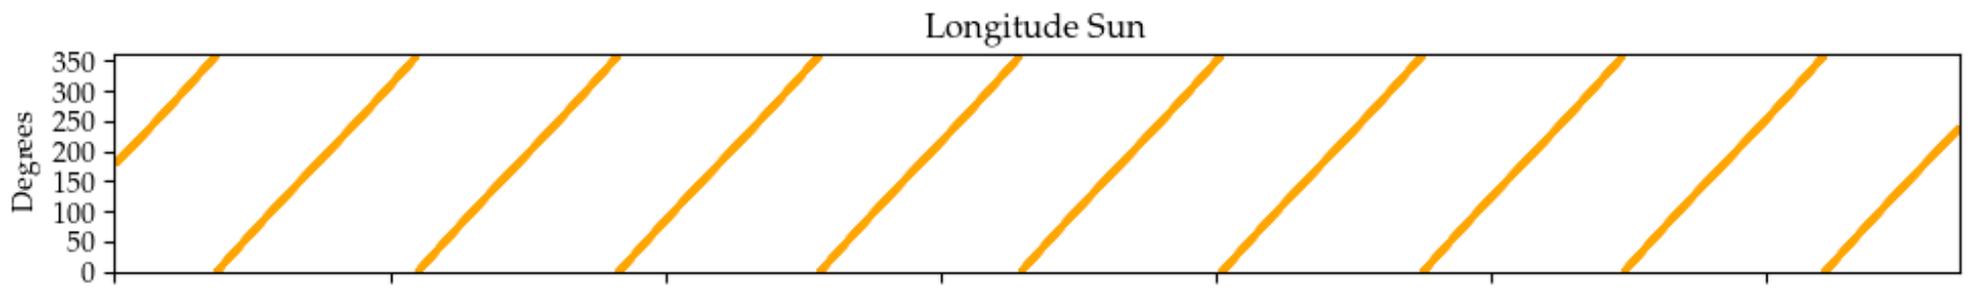

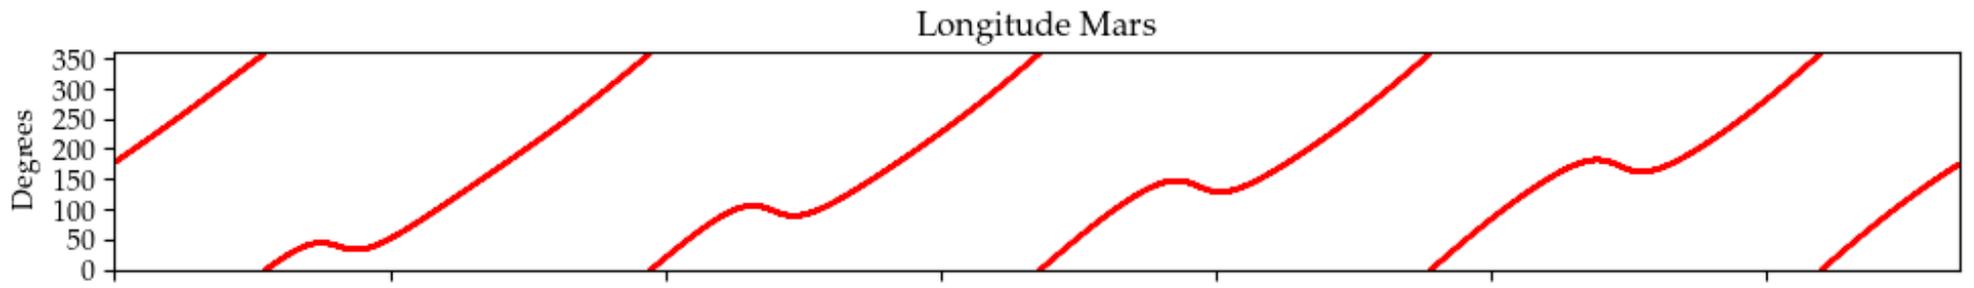

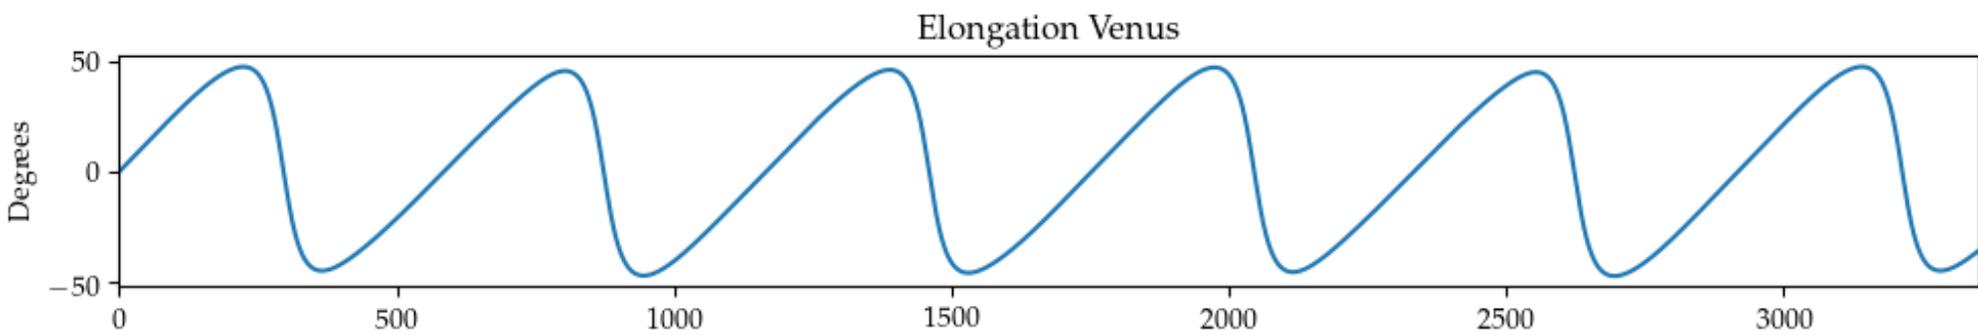

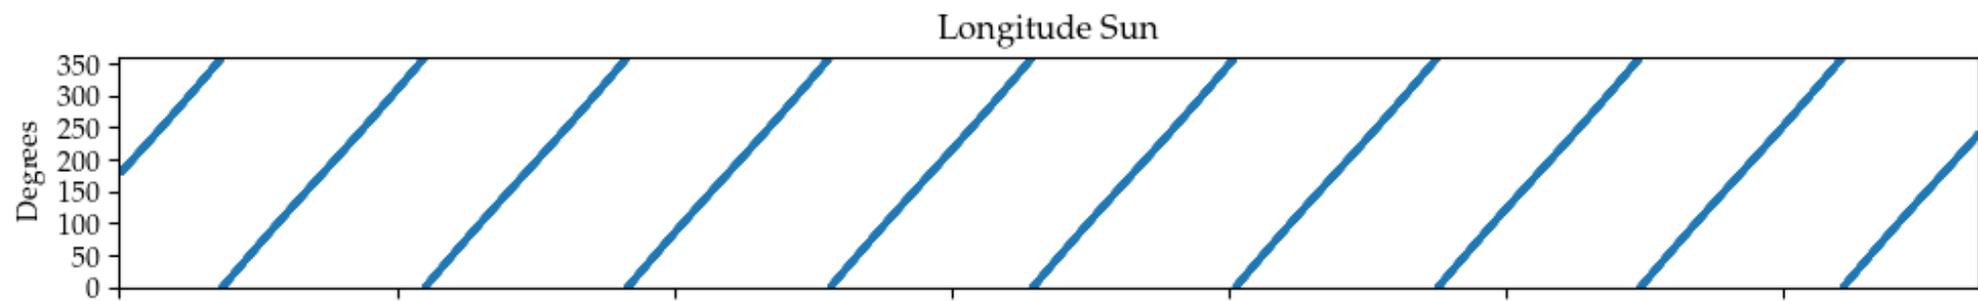

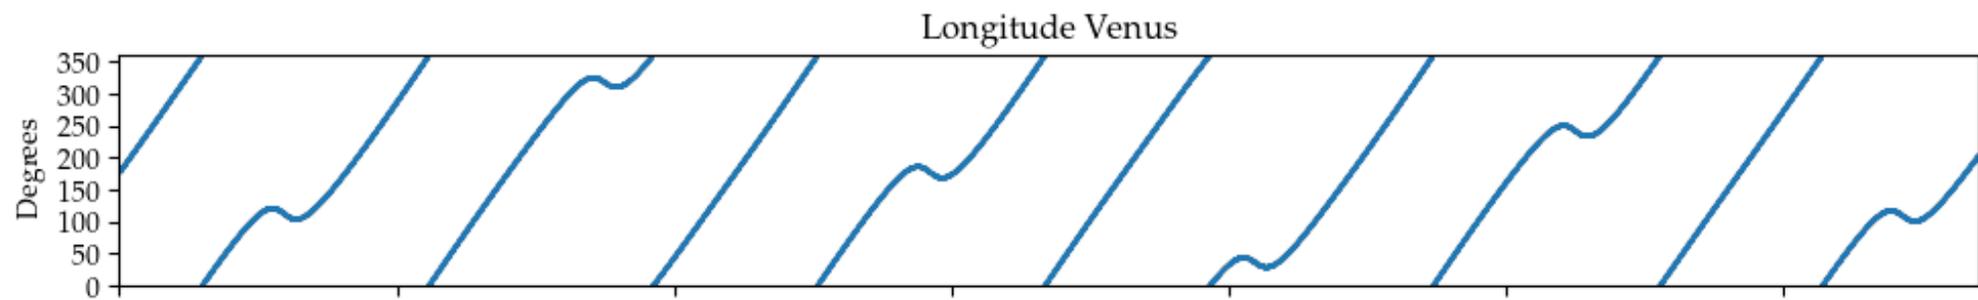

Mars Path in the Sky – Equatorial Coordinates

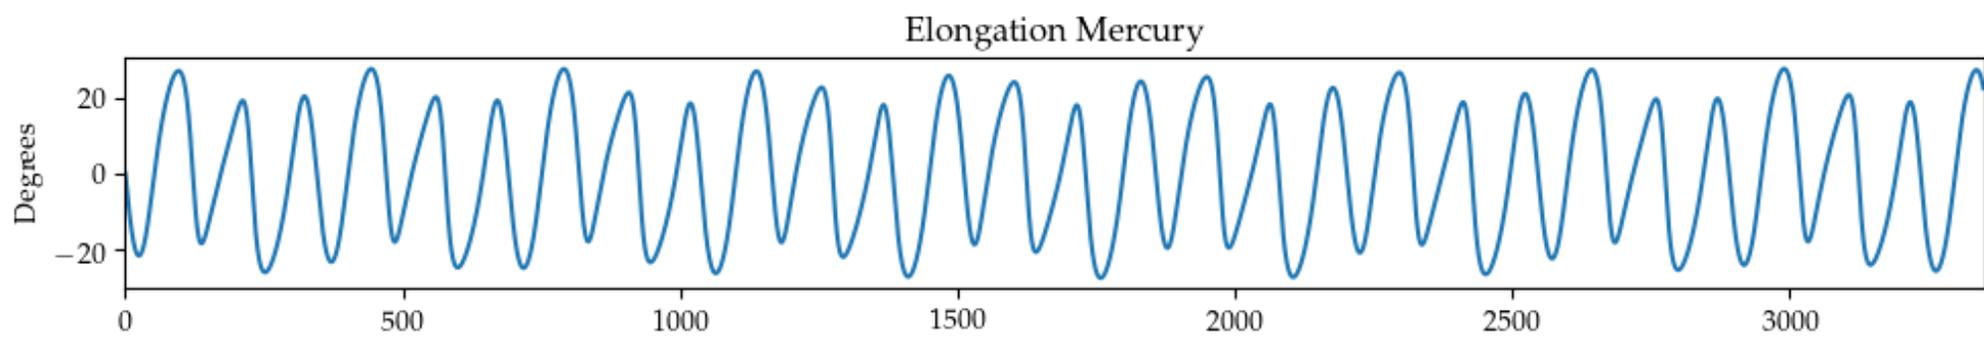

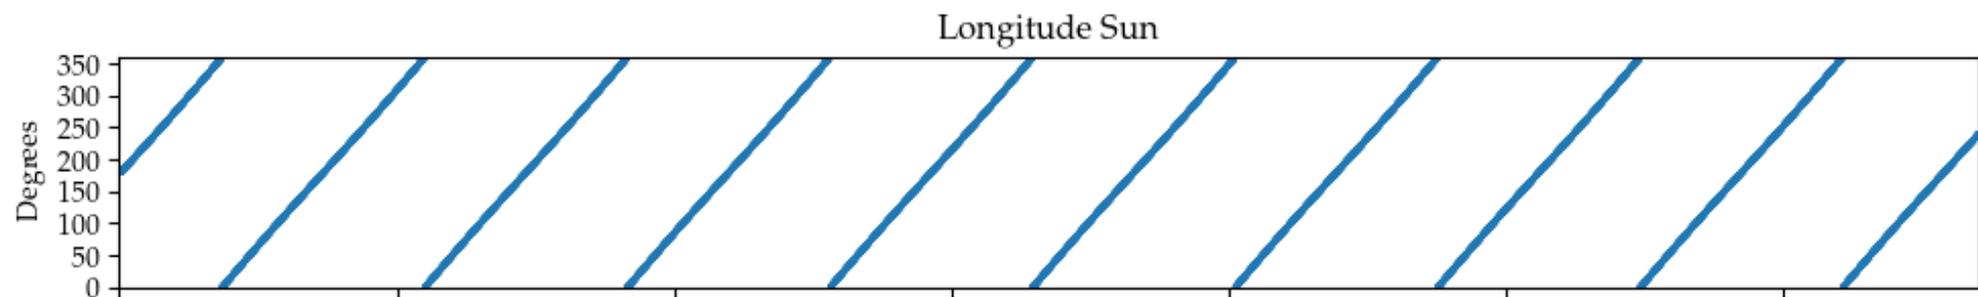

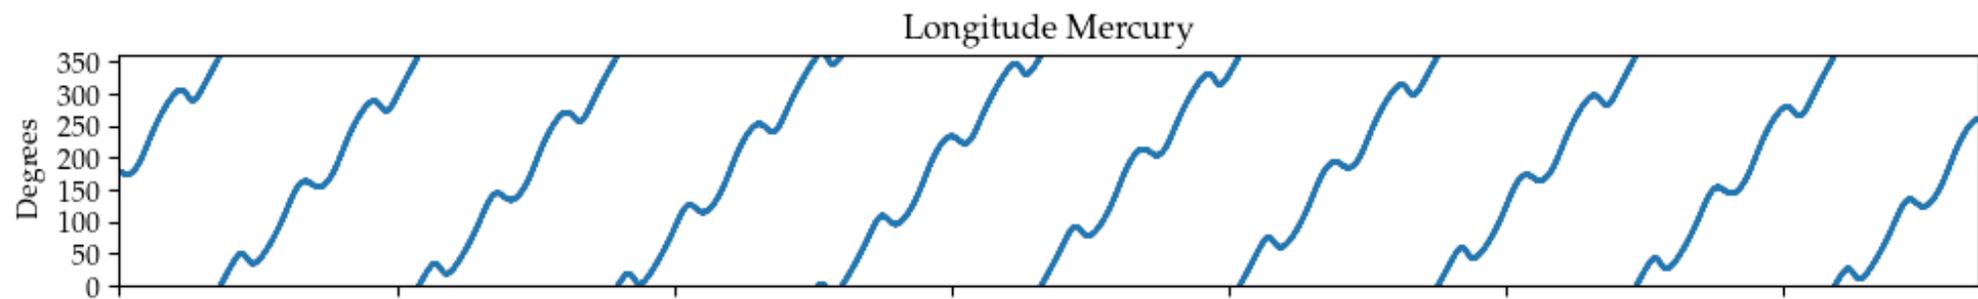

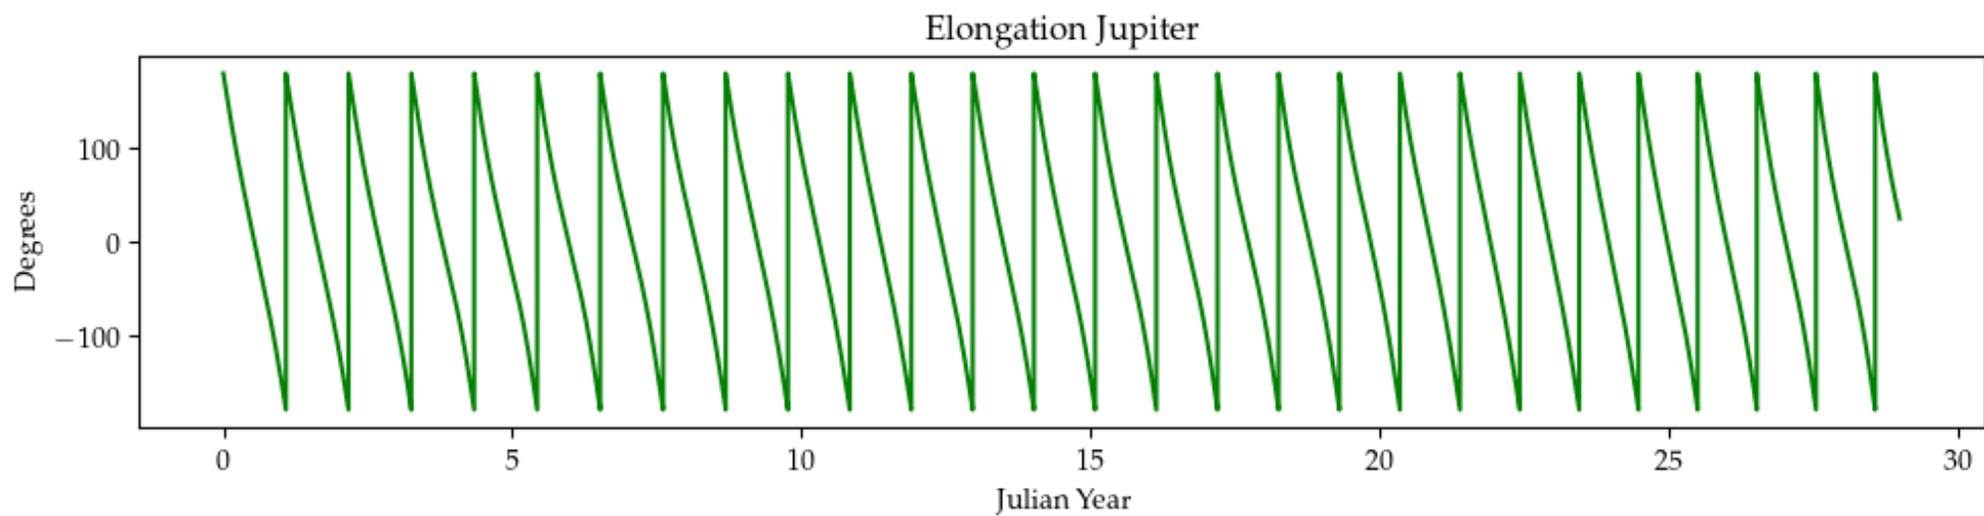

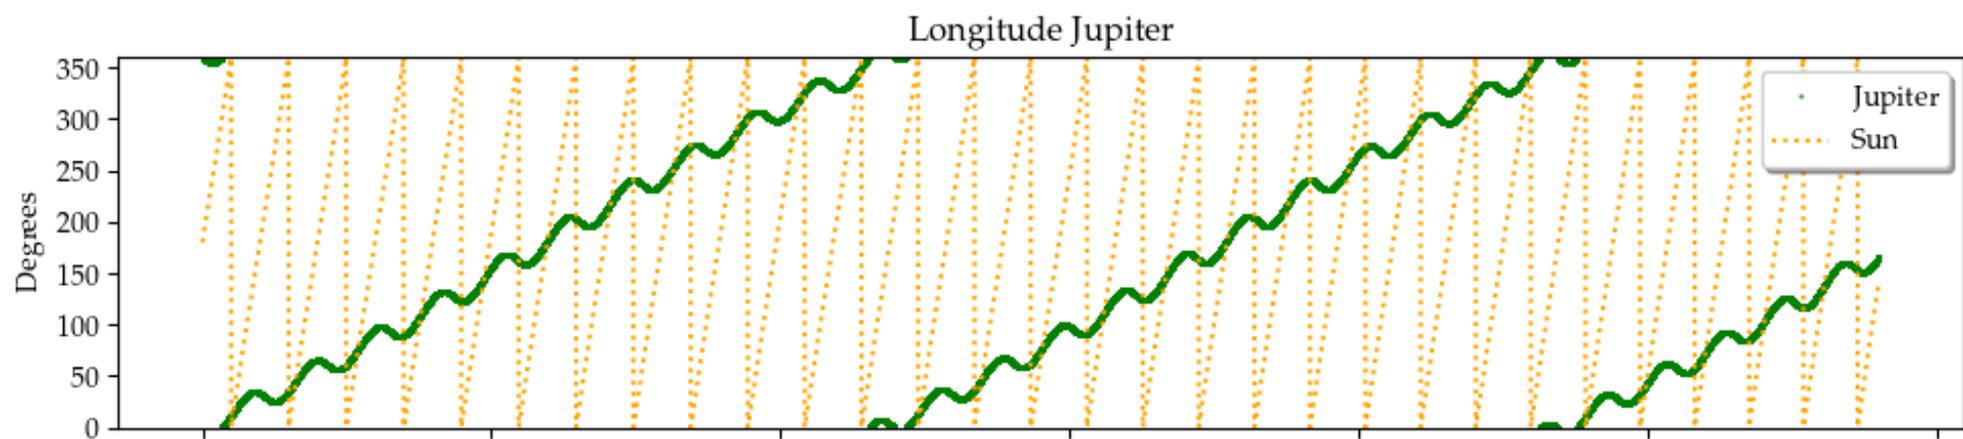

Mars Path in the Sky – Ecliptic Coordinates

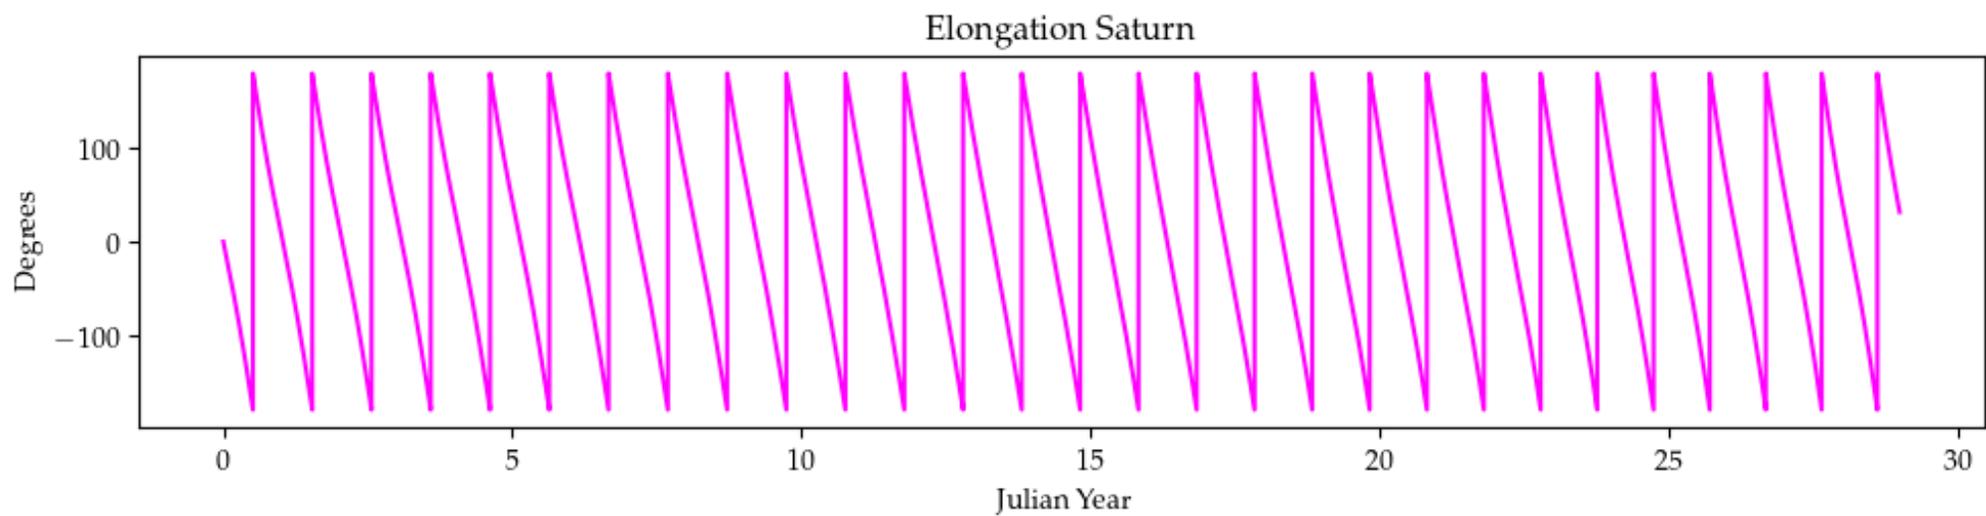

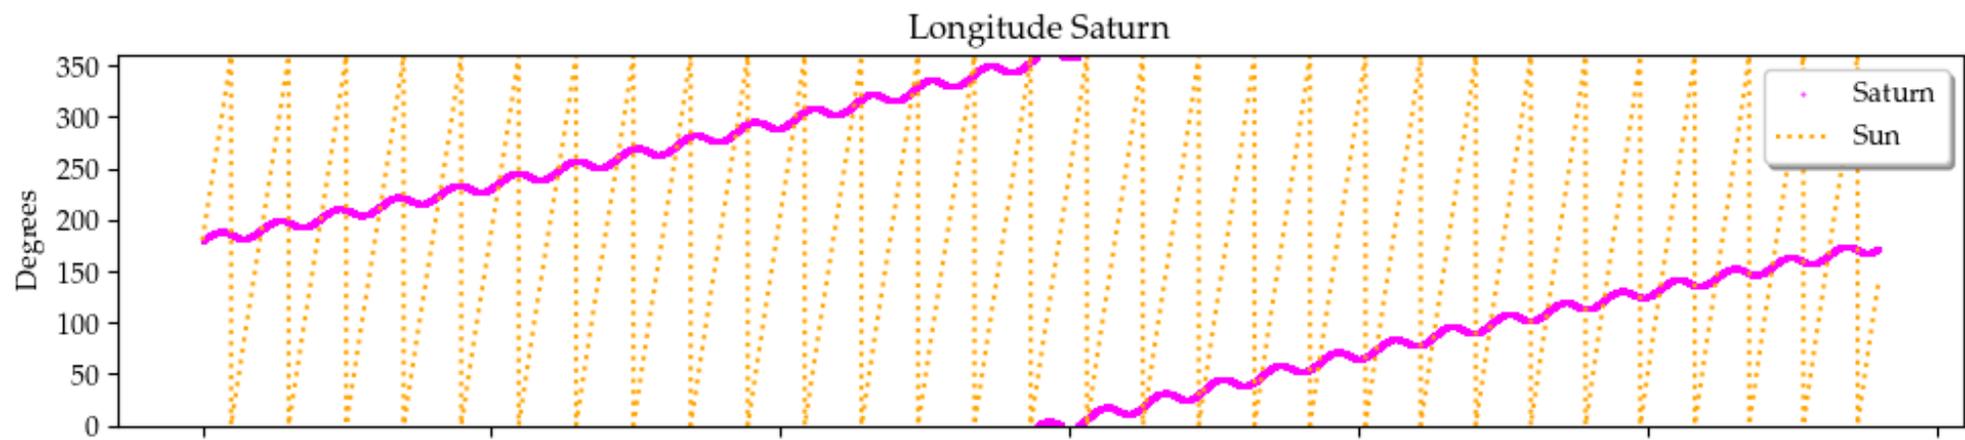

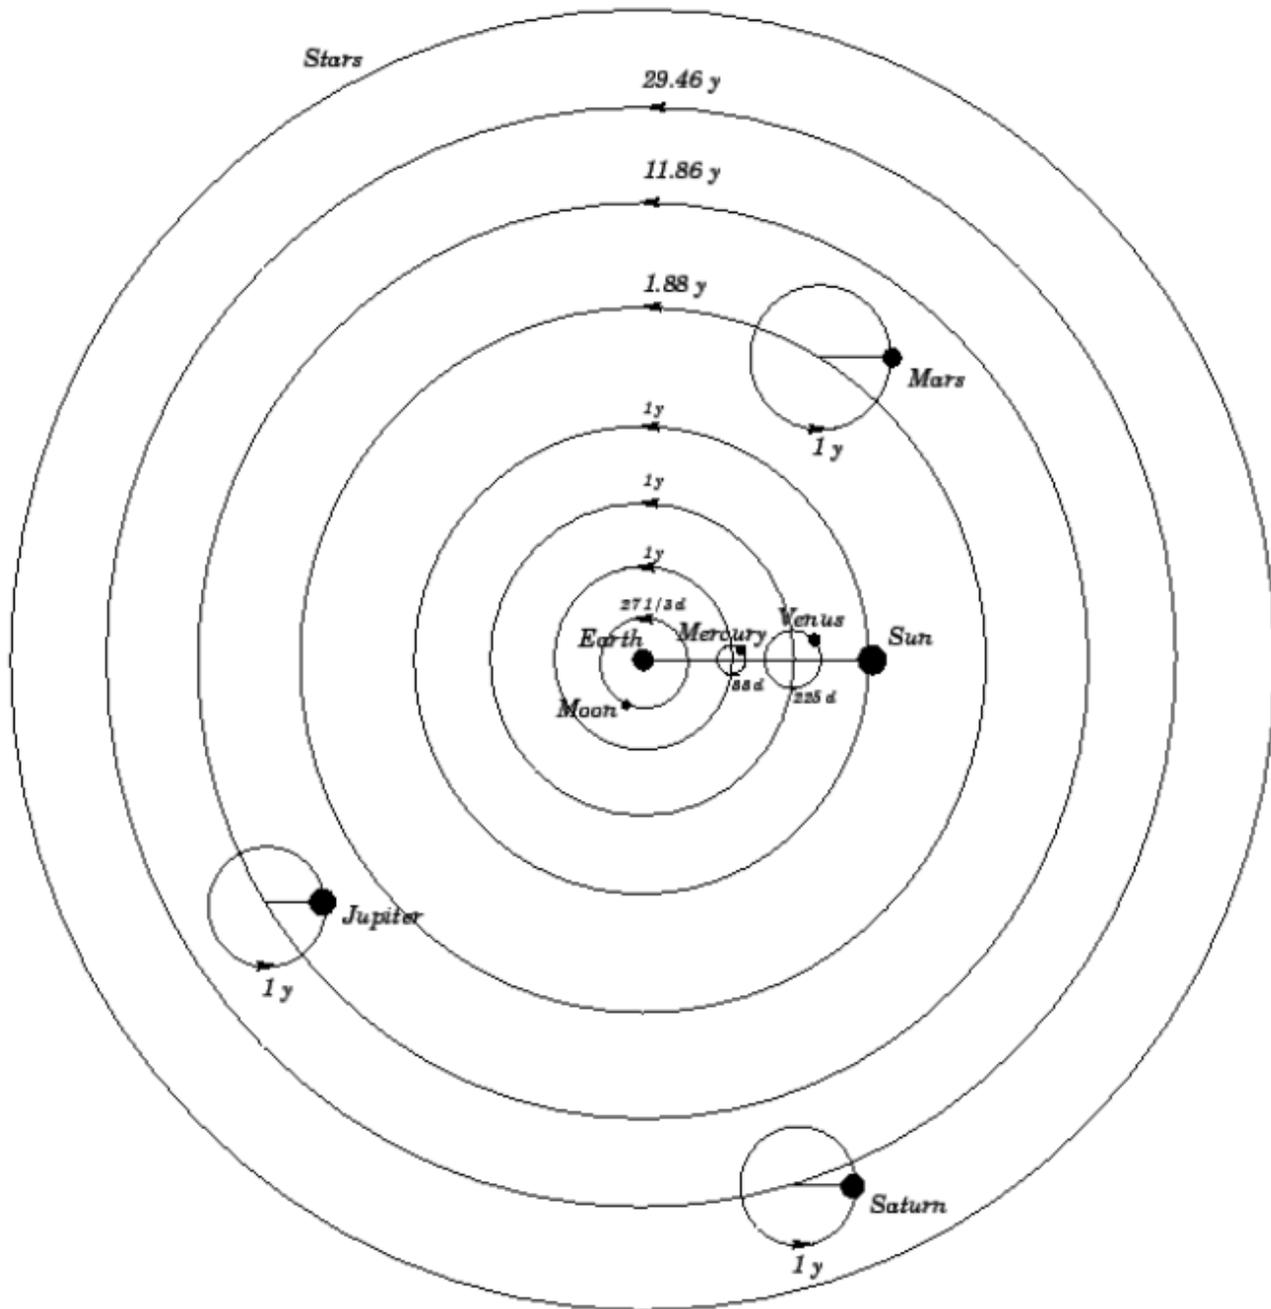

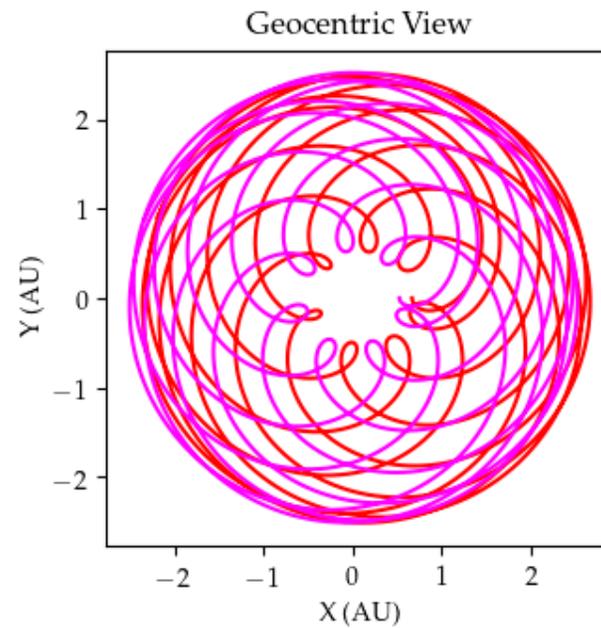

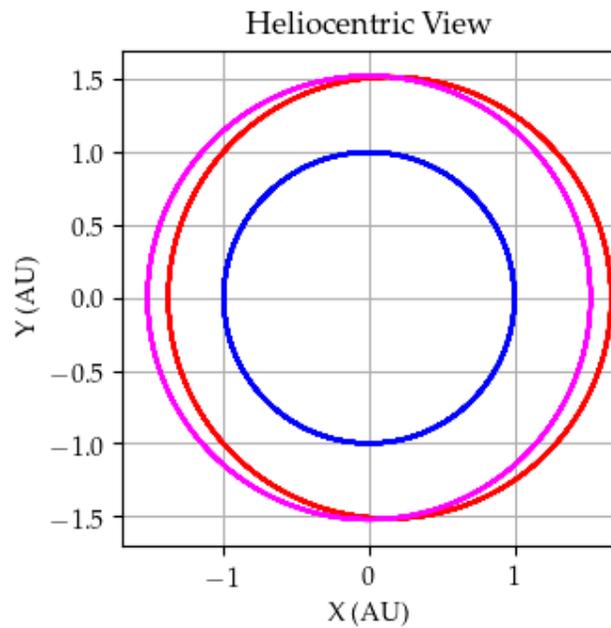

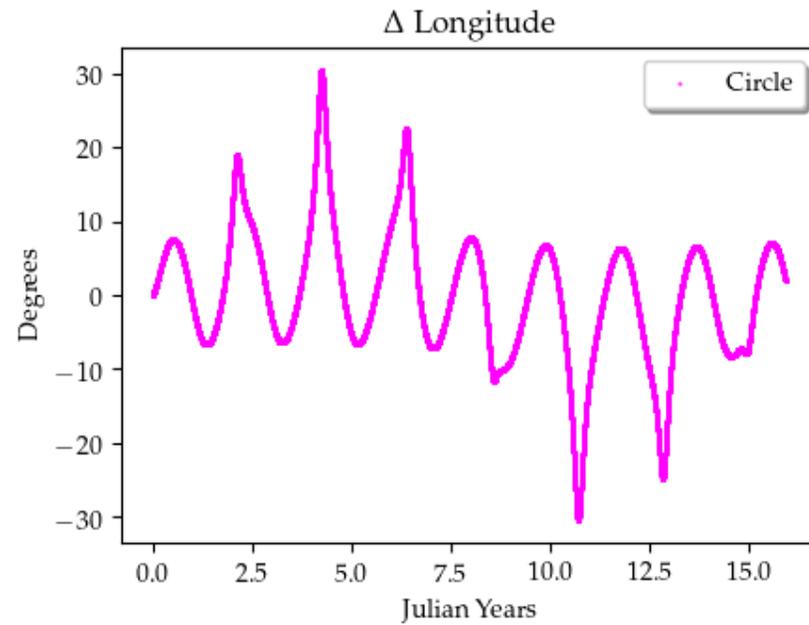

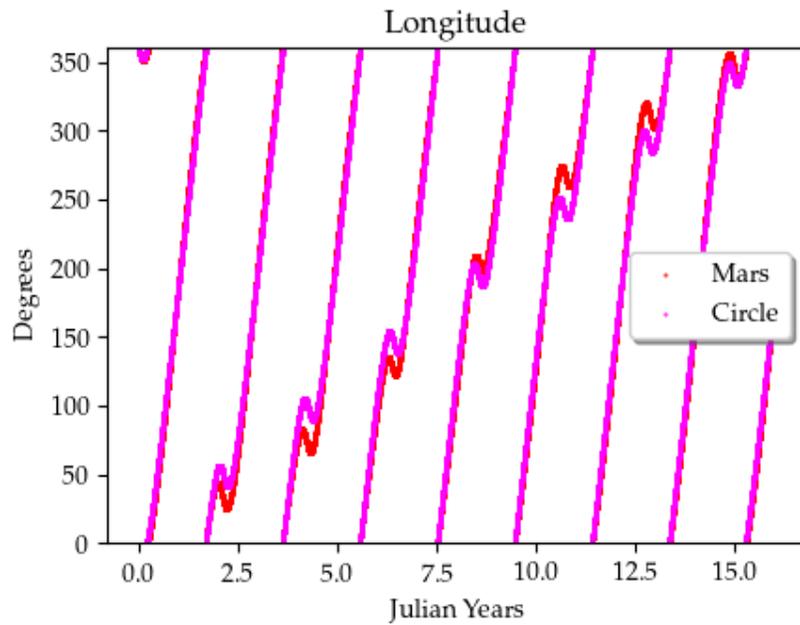

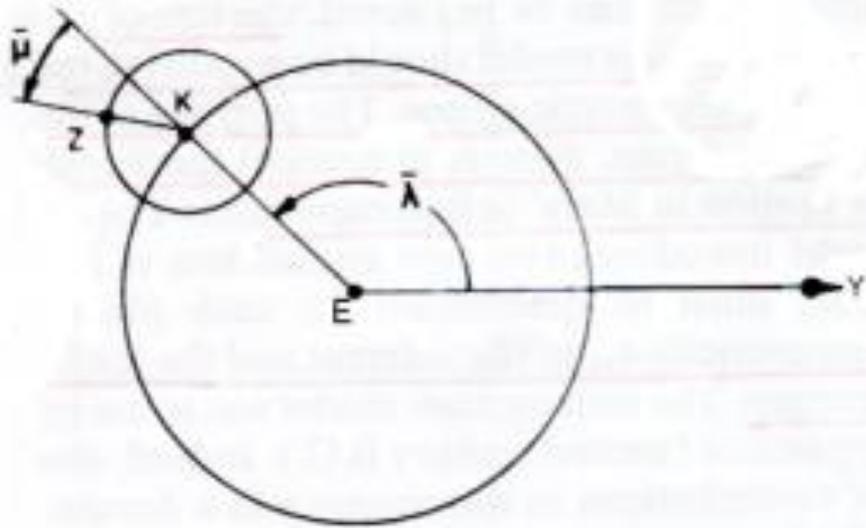

The Ptolemaic Model

Circular and Centered Orbit

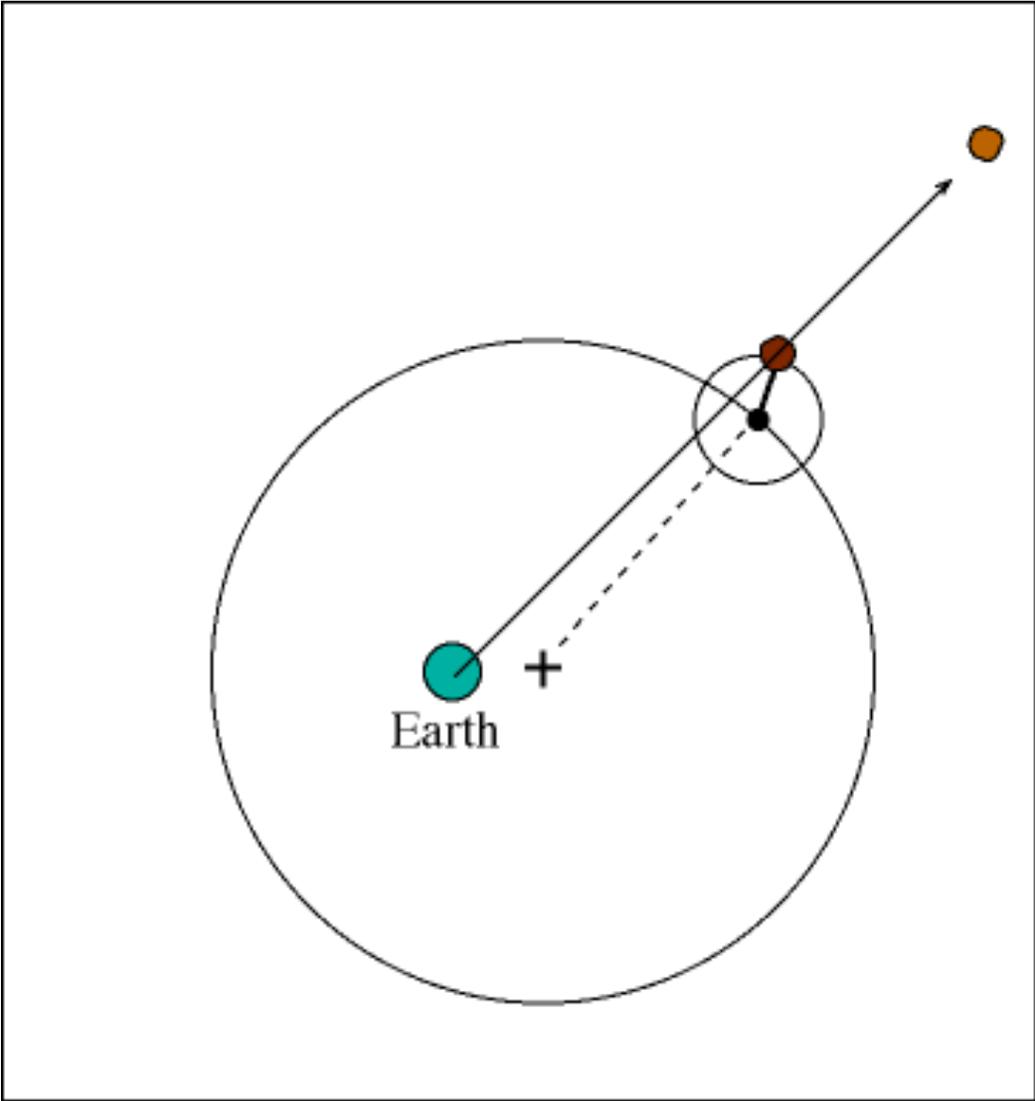

Regular Epicycles produce regular retrogradations

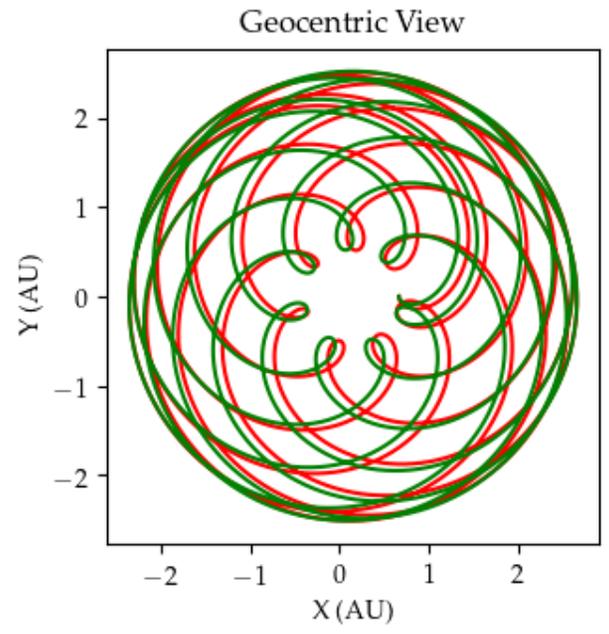

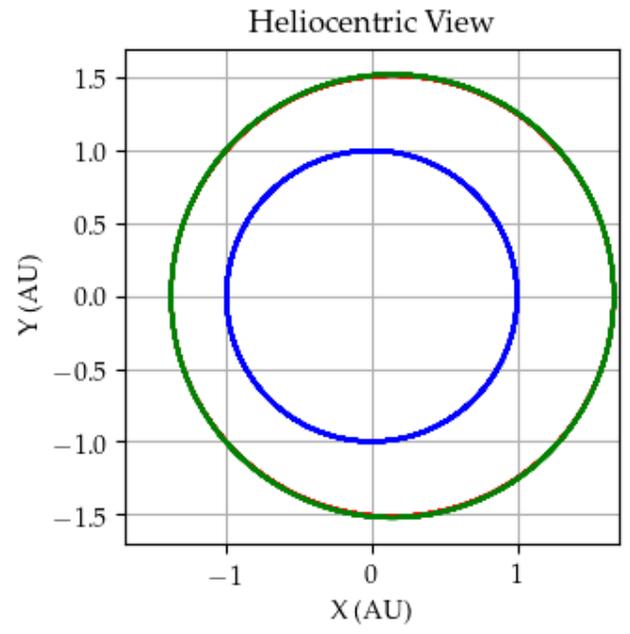

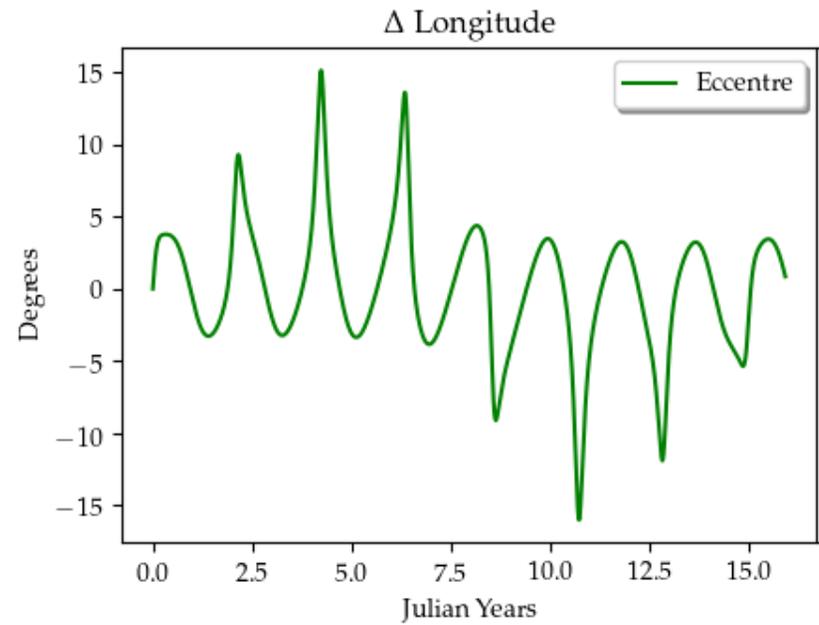

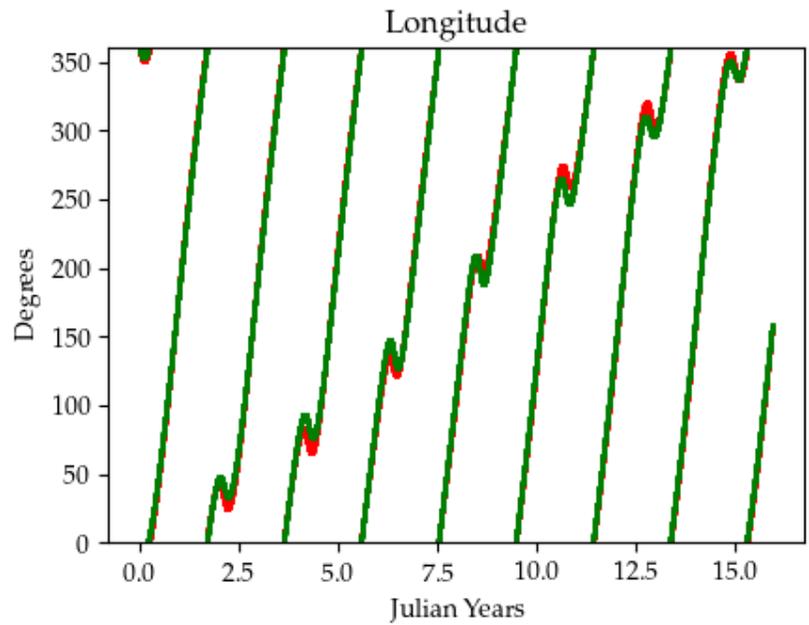

In reality the retrogradations vary both in position and duration.

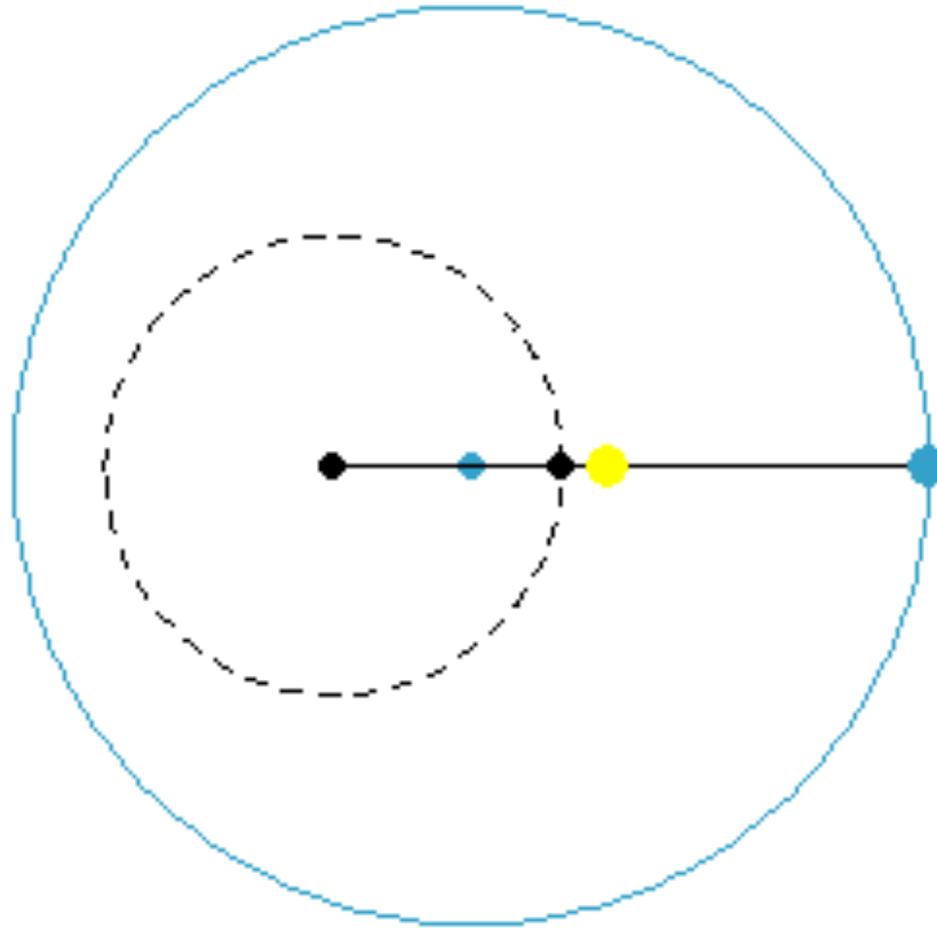

Move the Earth from the Center

Circular Off-Centered Orbit (the Eccentre)

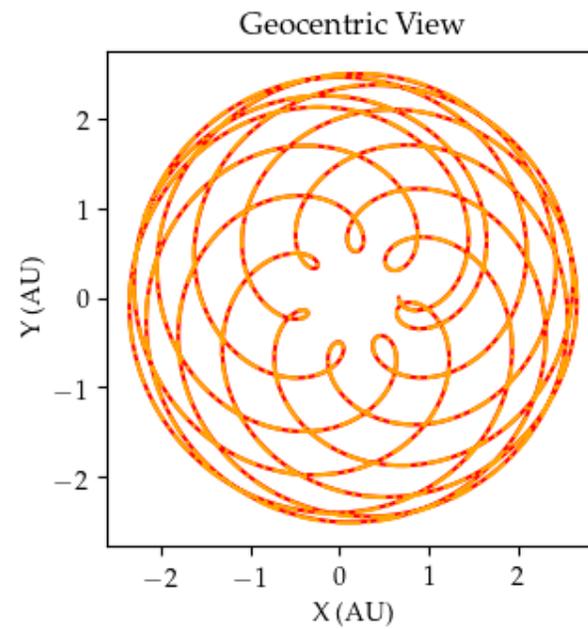

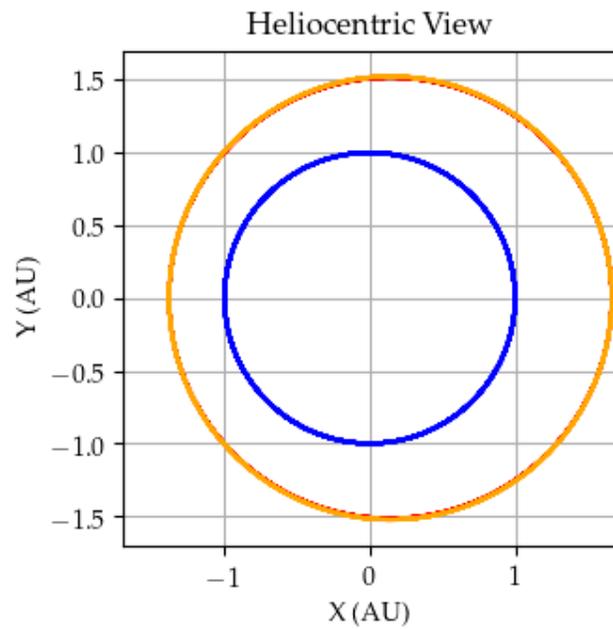

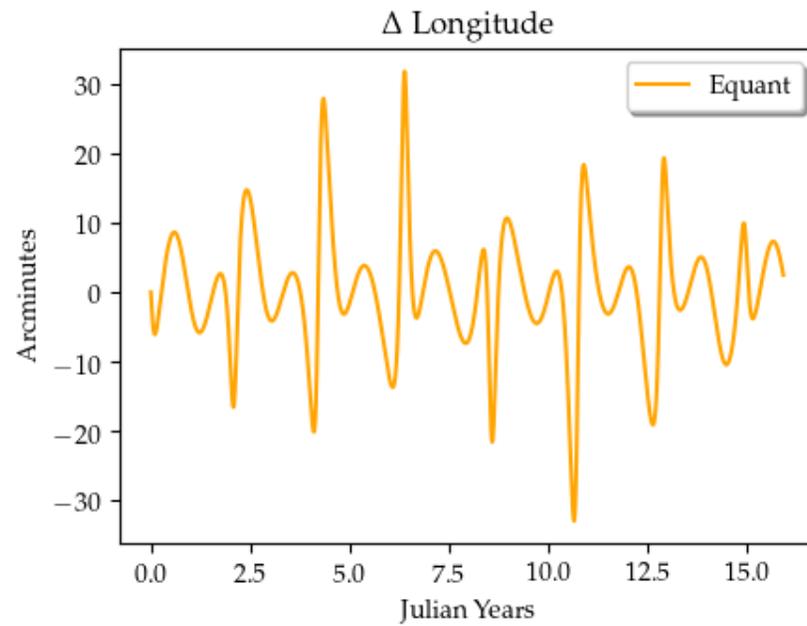

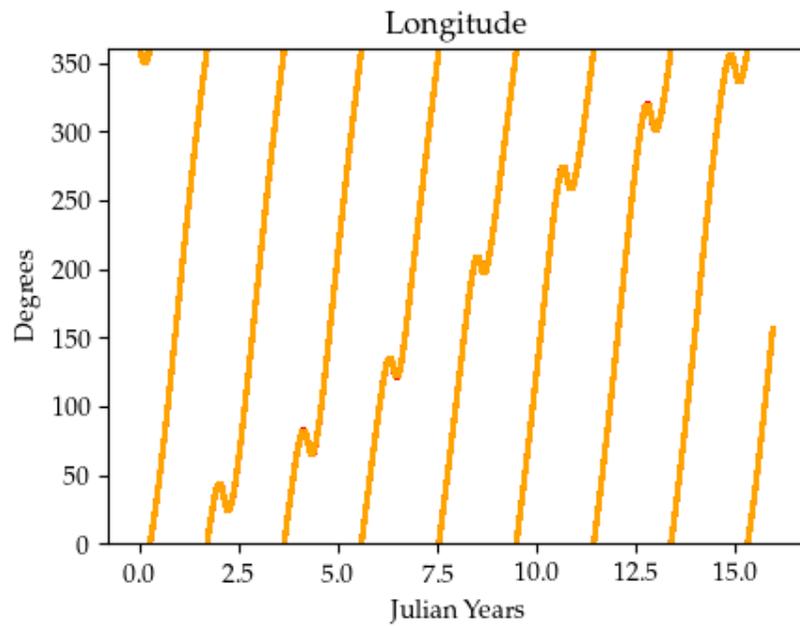

The Equant

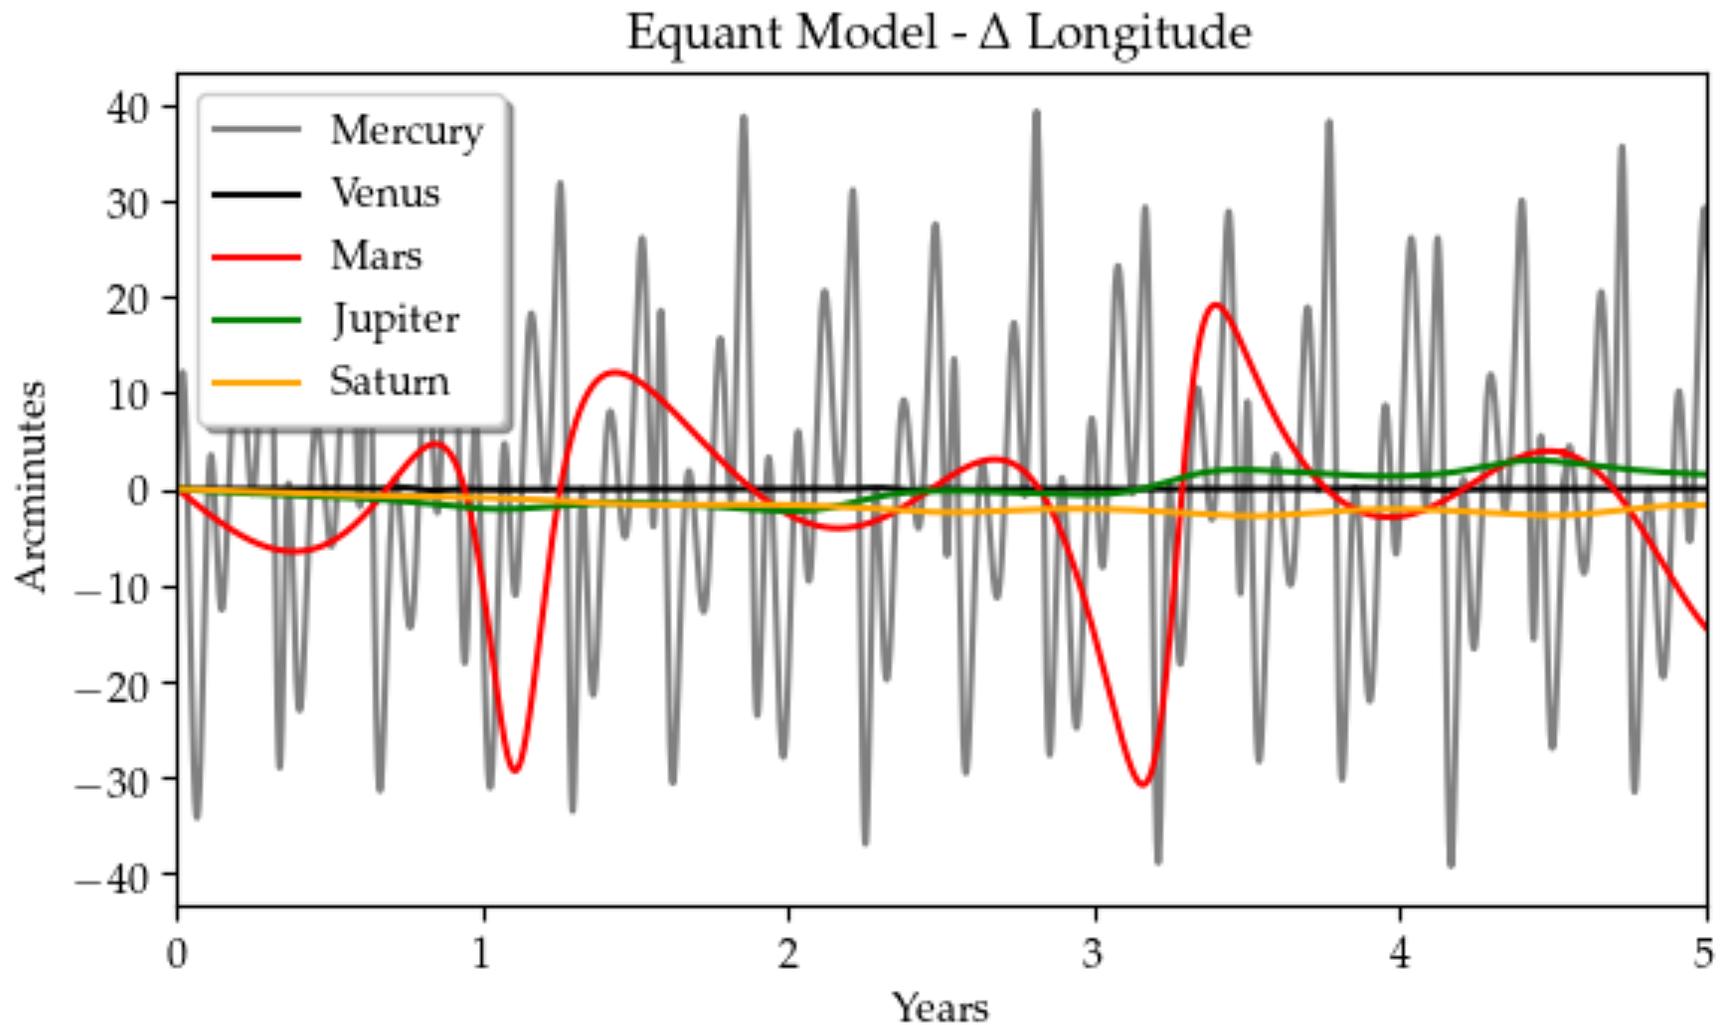

**Around a special point (the equant),
the motion is uniform**

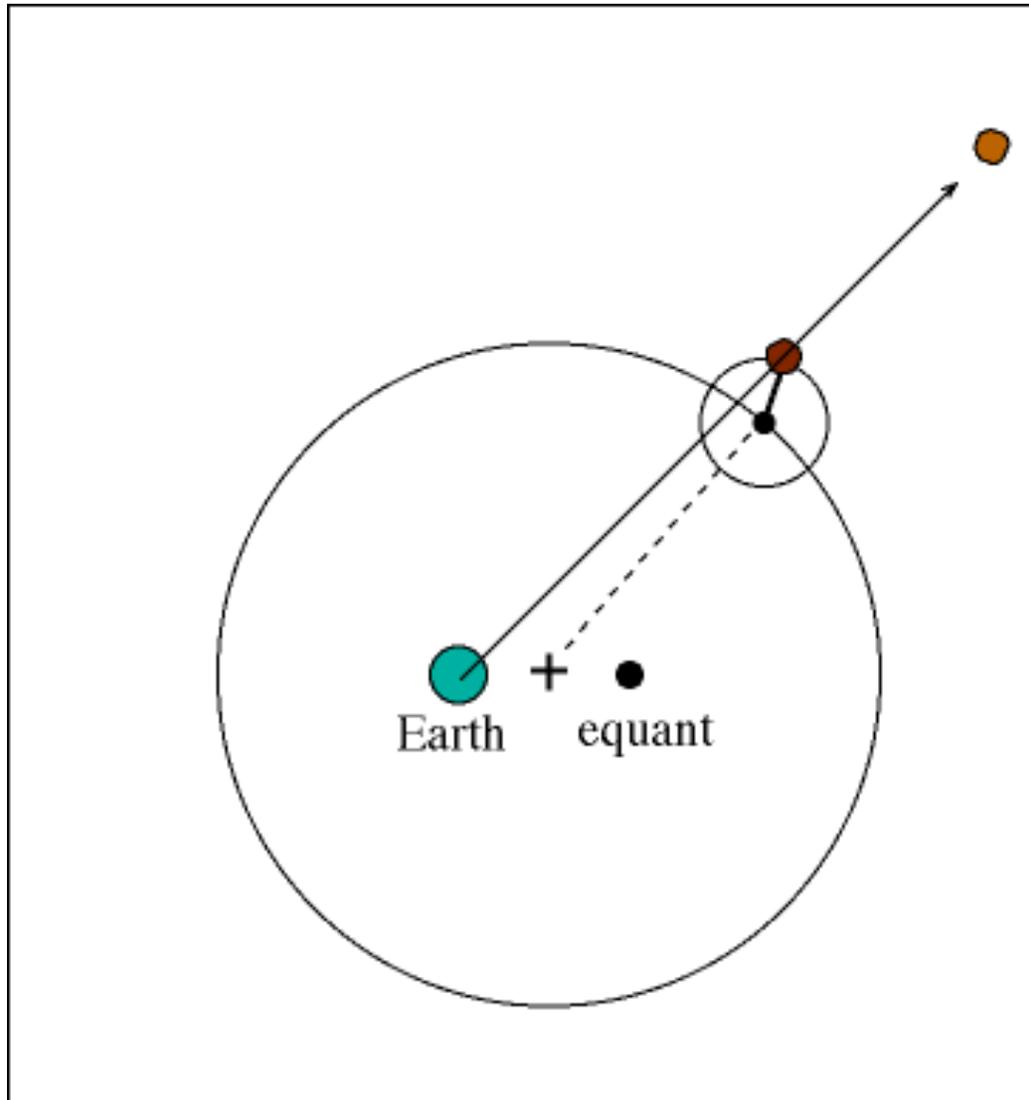

The Equant

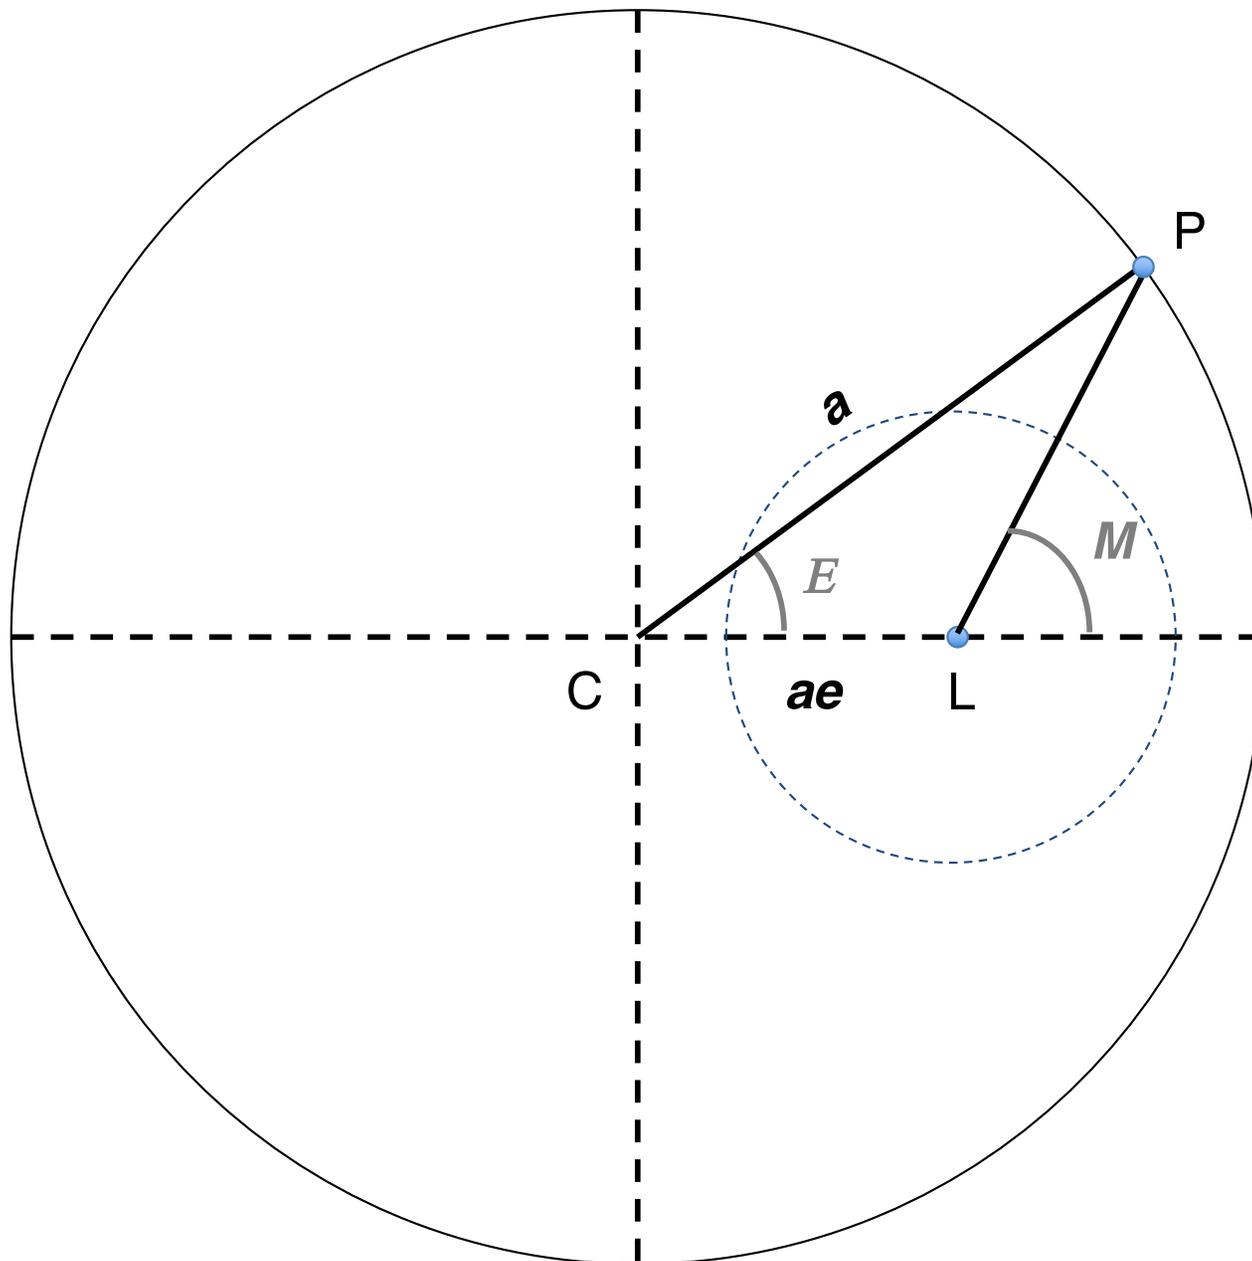

The Equant

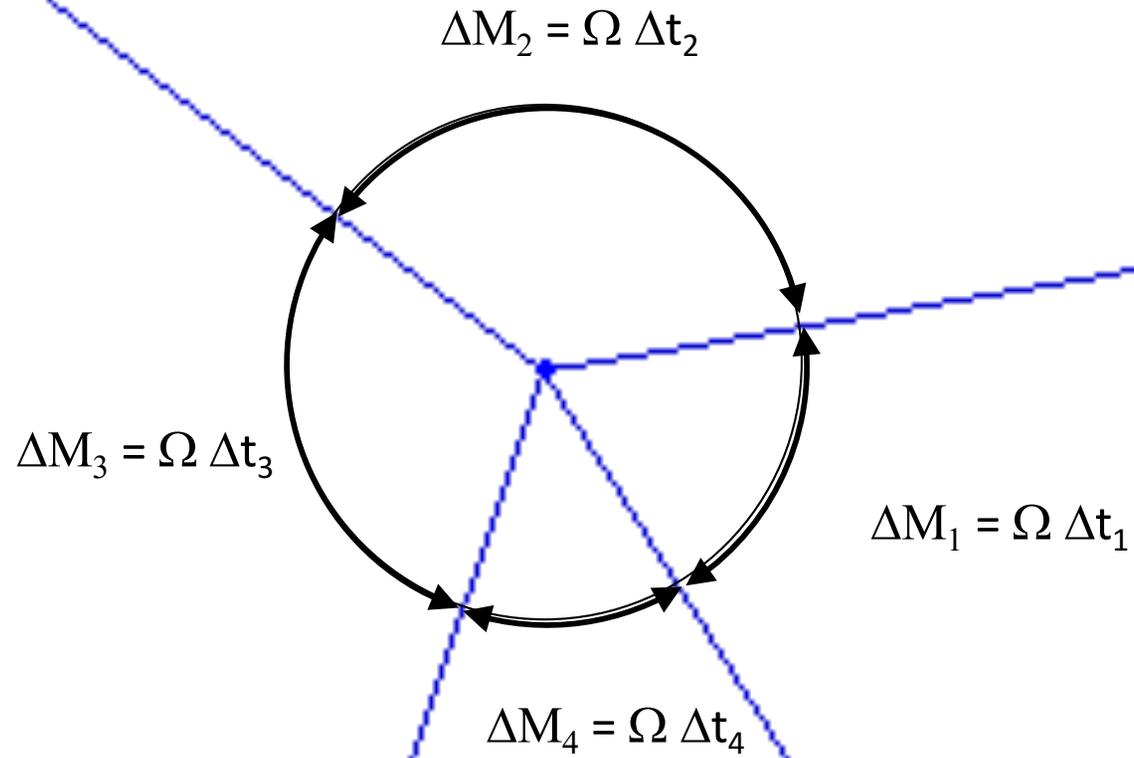

Even for the highest eccentricity (Mercury), the equant reproduces the observations to less than a degree accuracy.

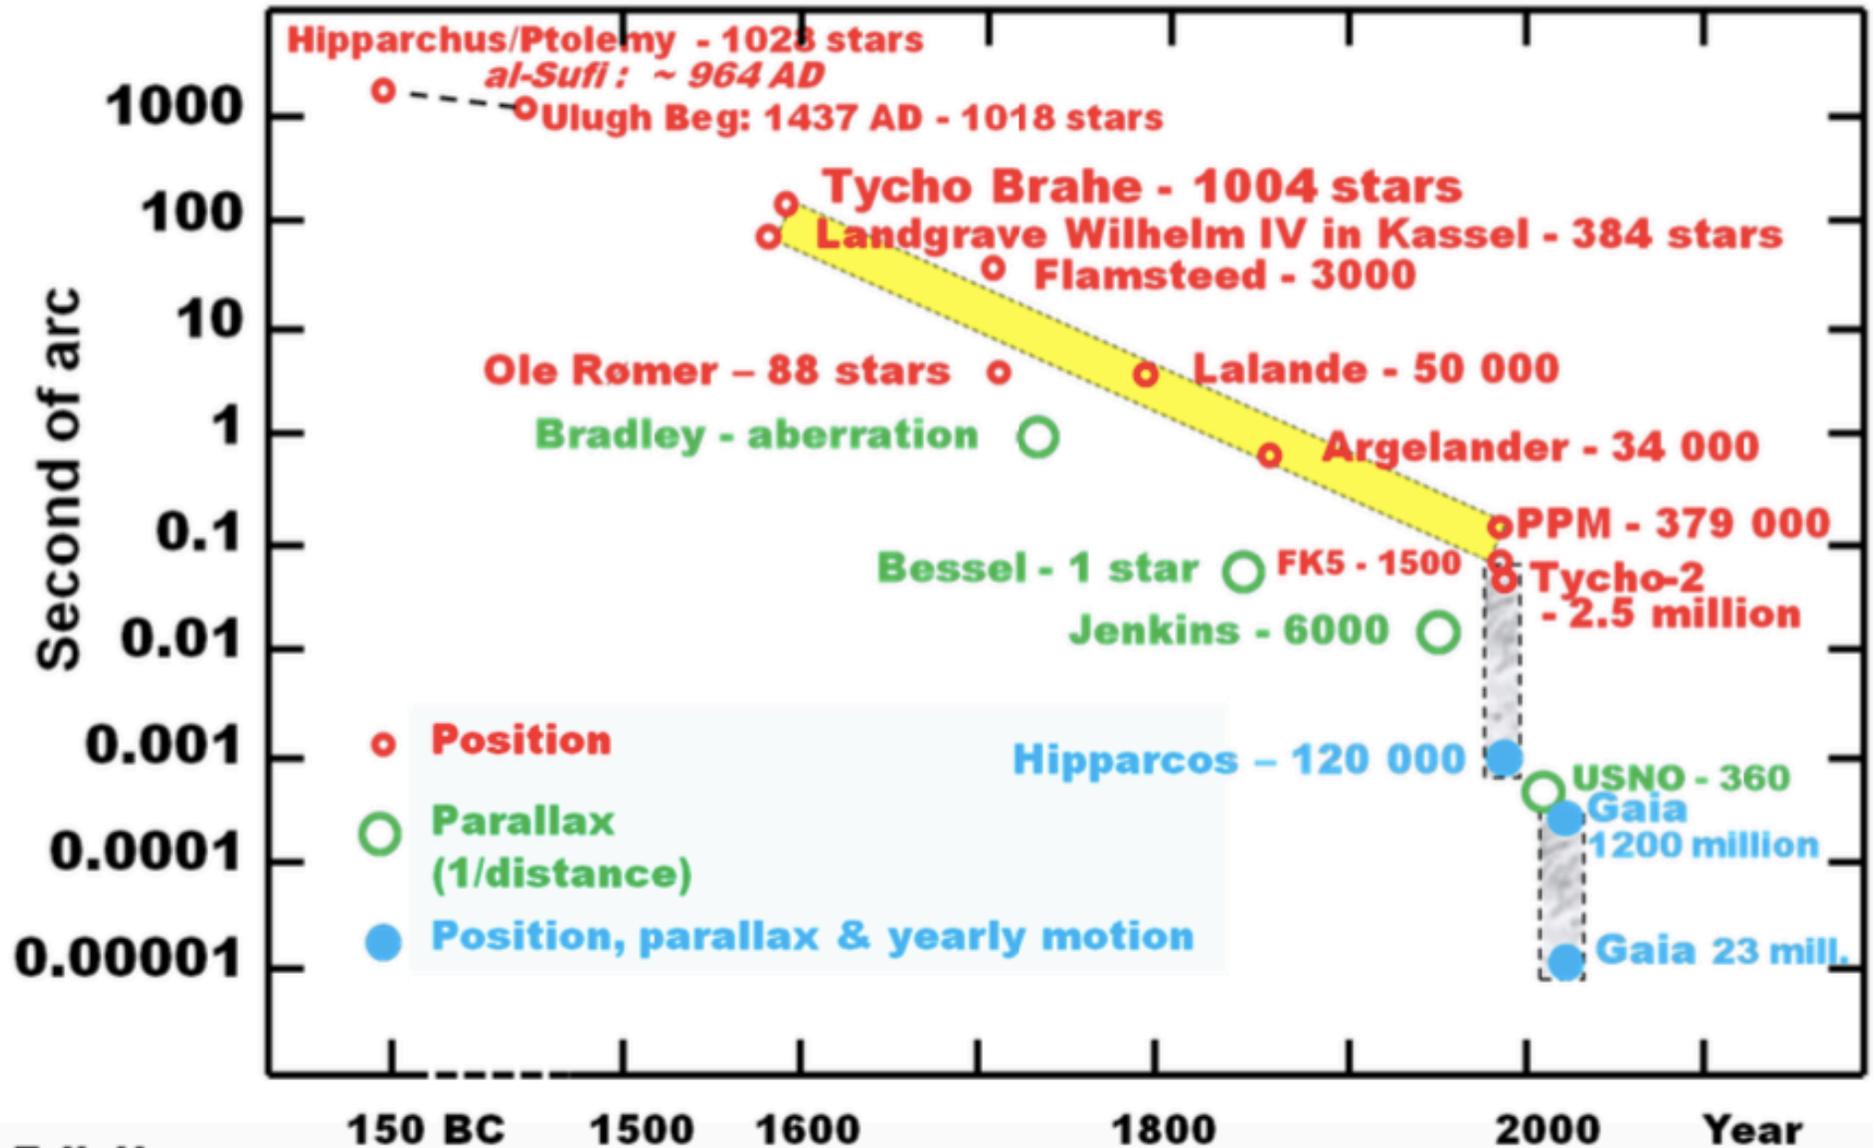

The Equant

Equant Point of View

Astrometric Accuracy during 2000 Years

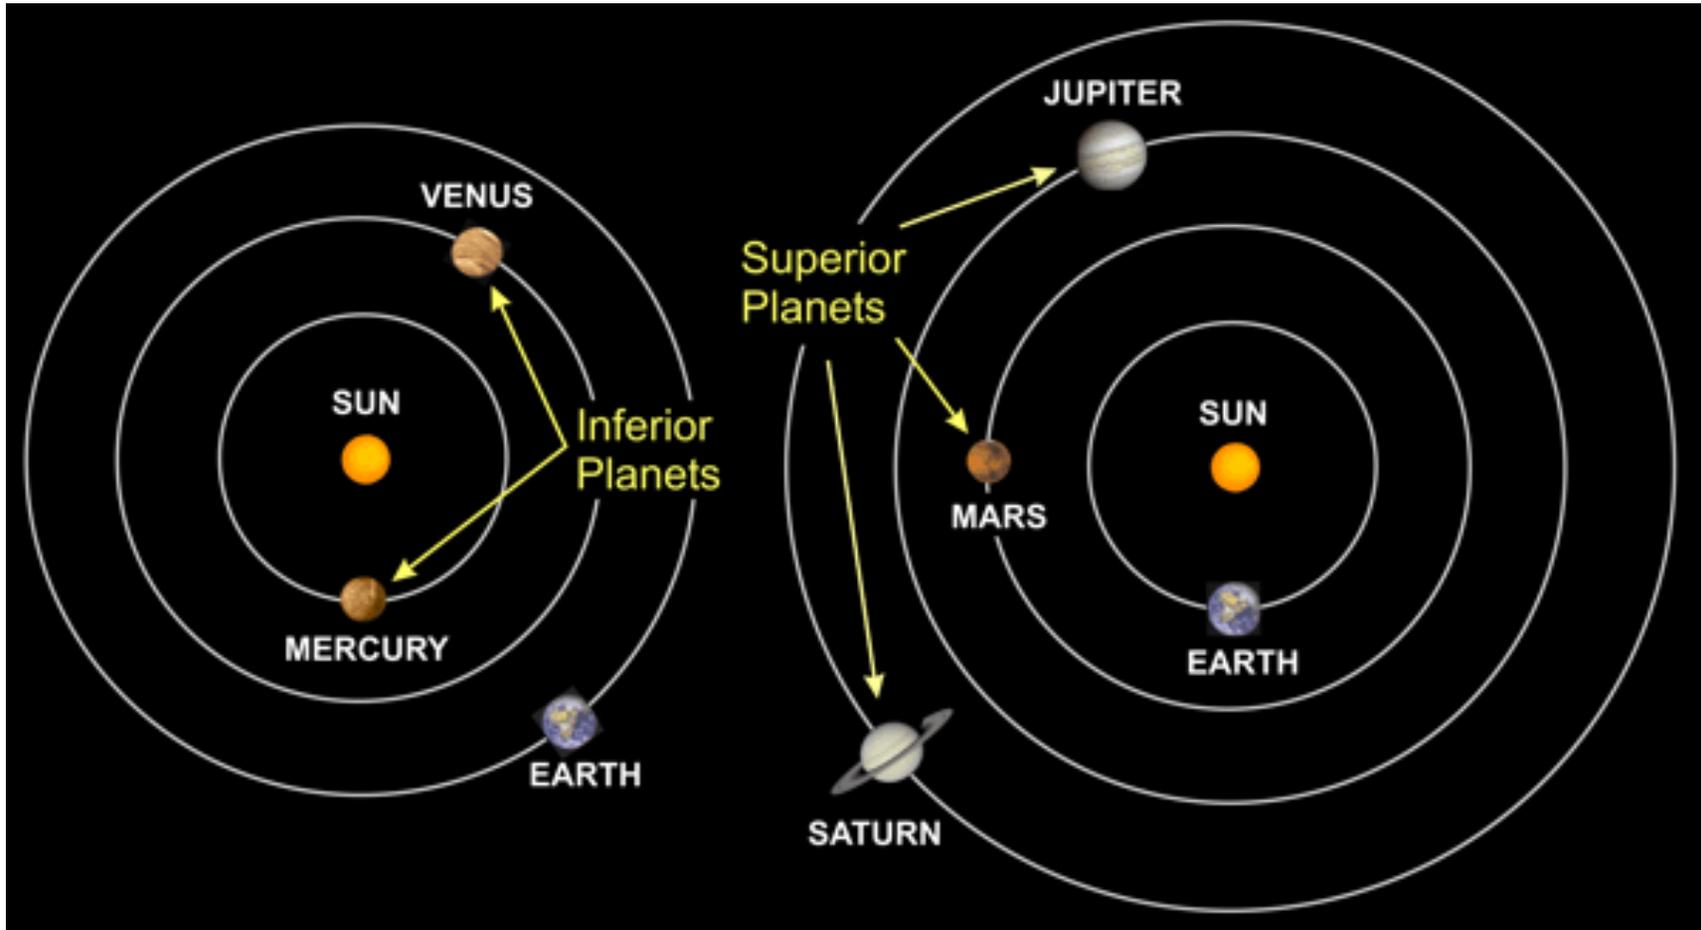

Heliocentrism

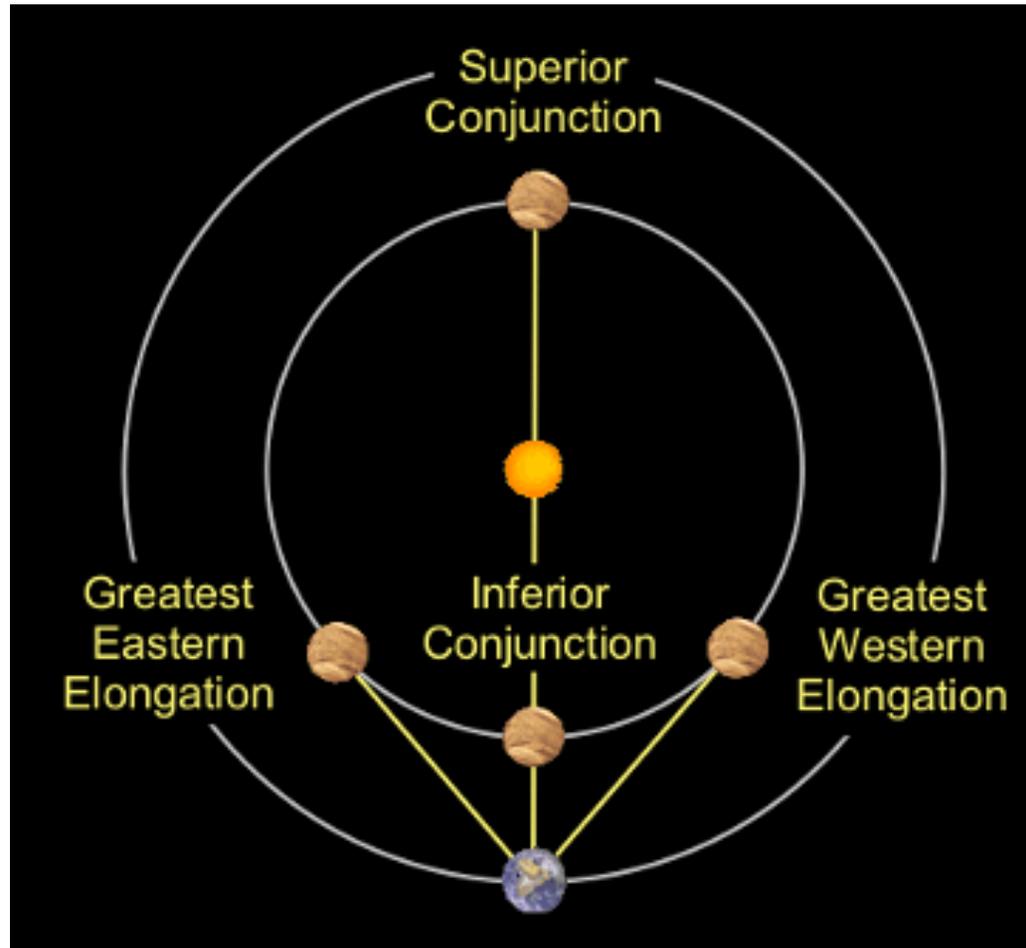

Geocentrism

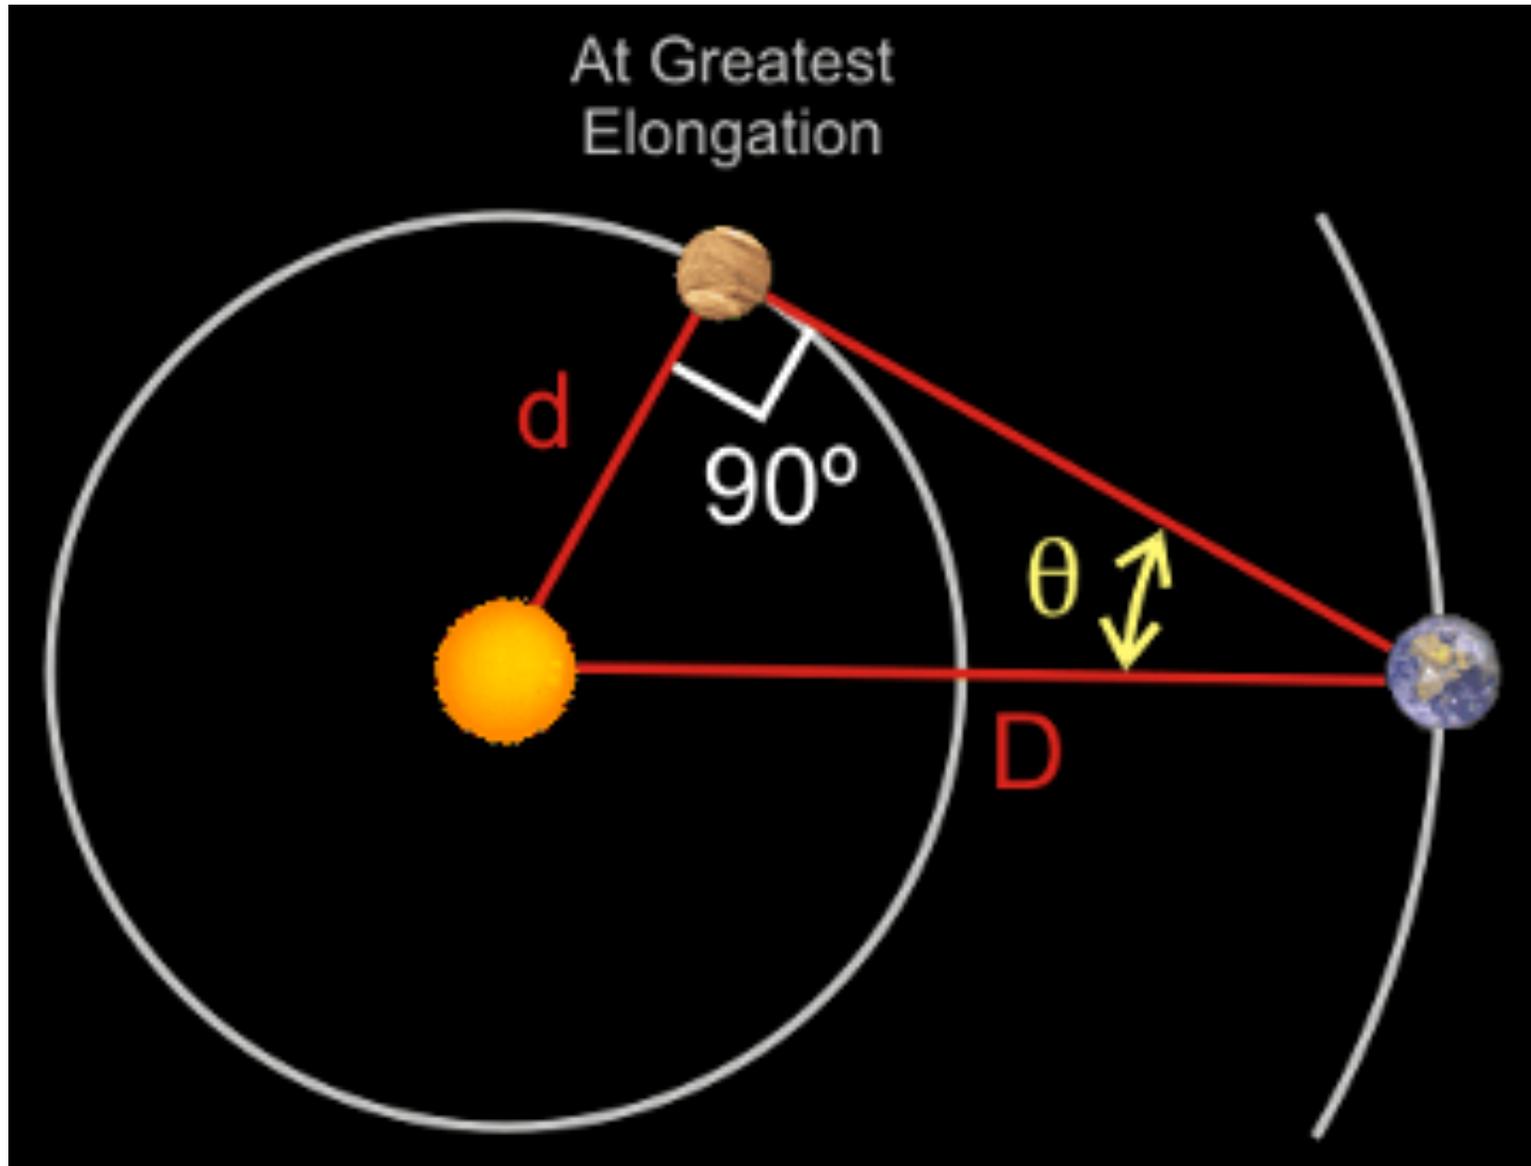

Inferior and Superior planets in the Copernican Model

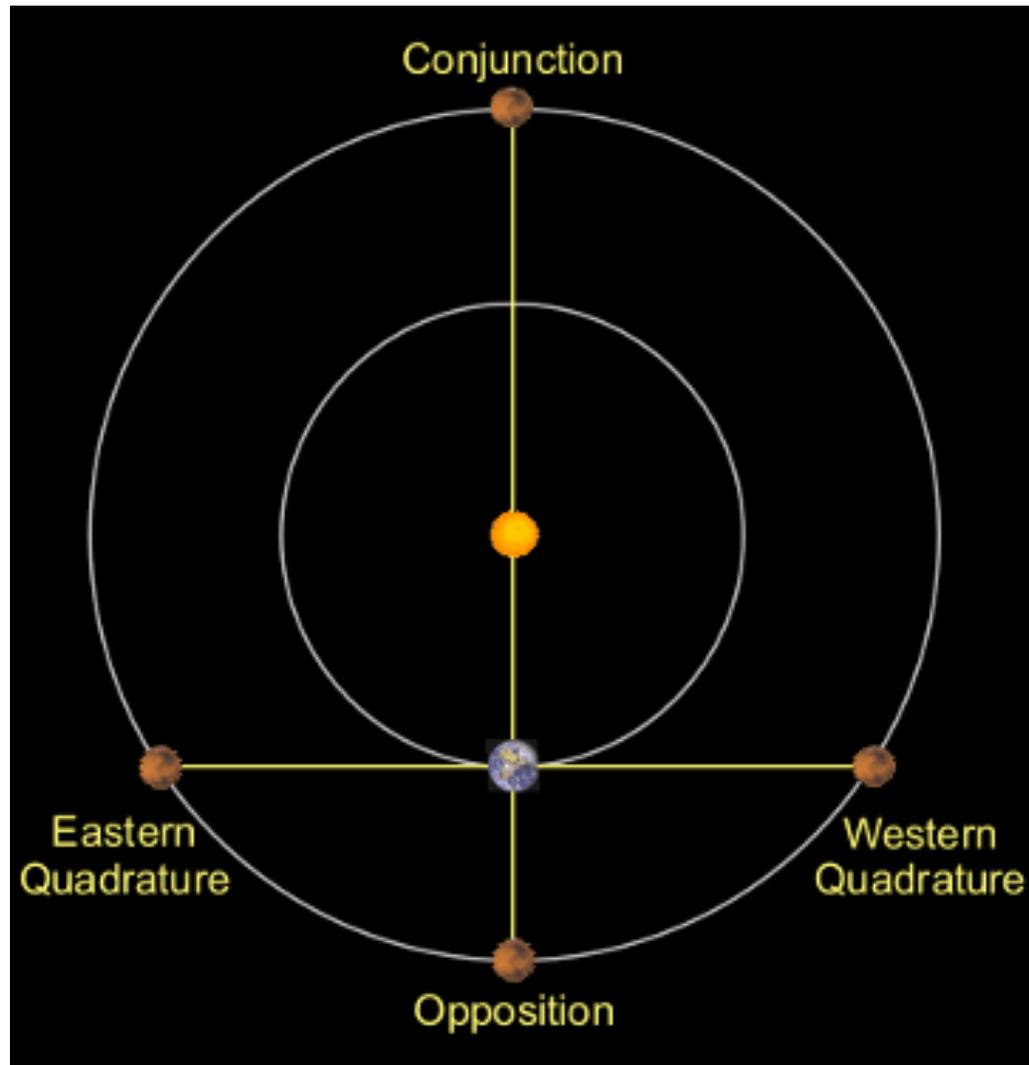

Inferior planets : special points

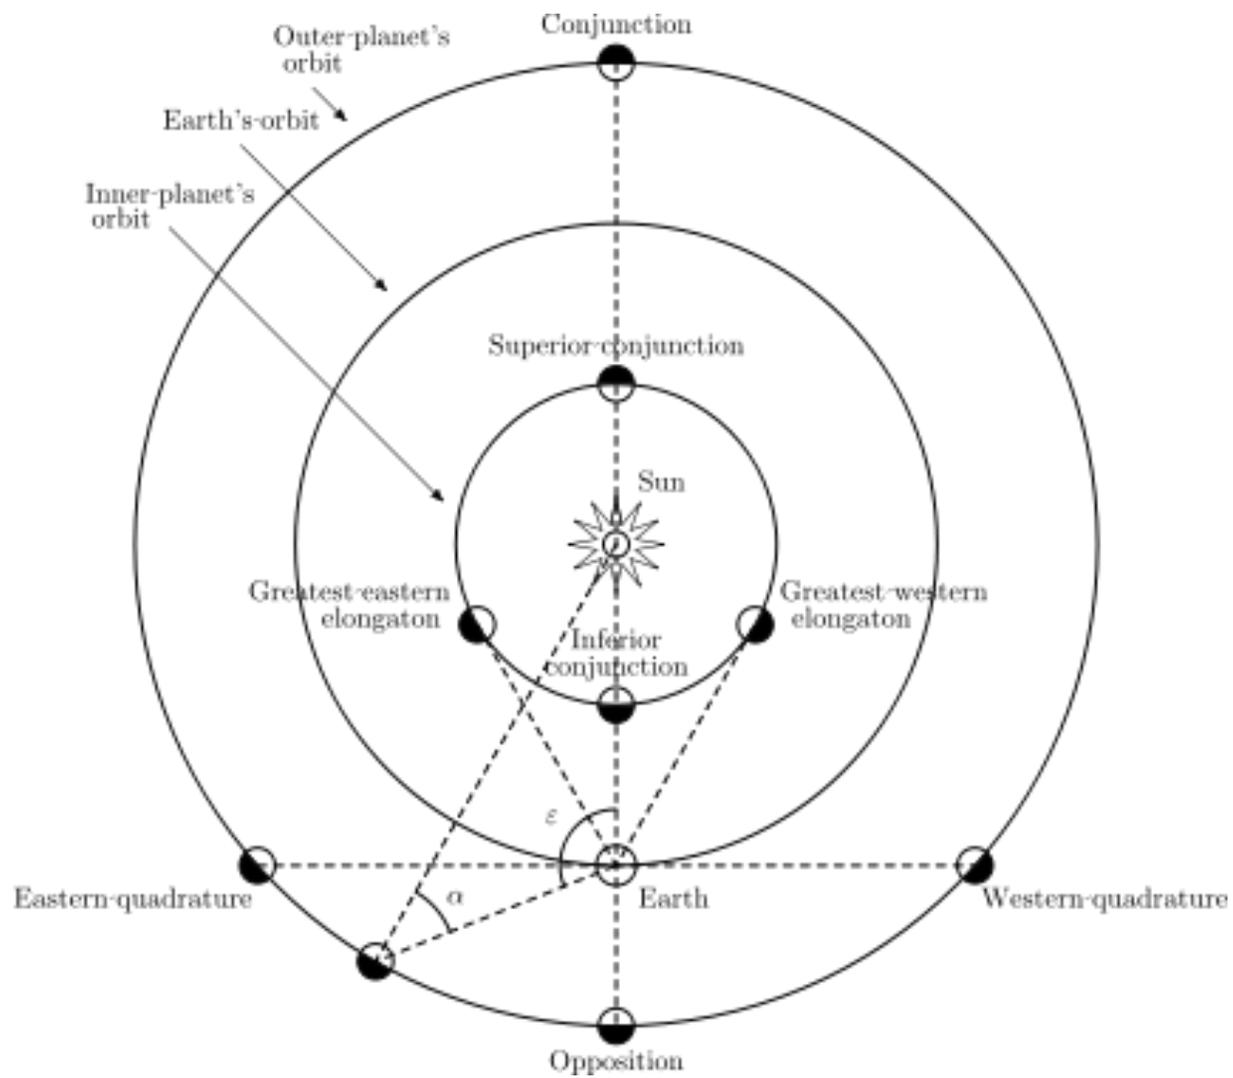

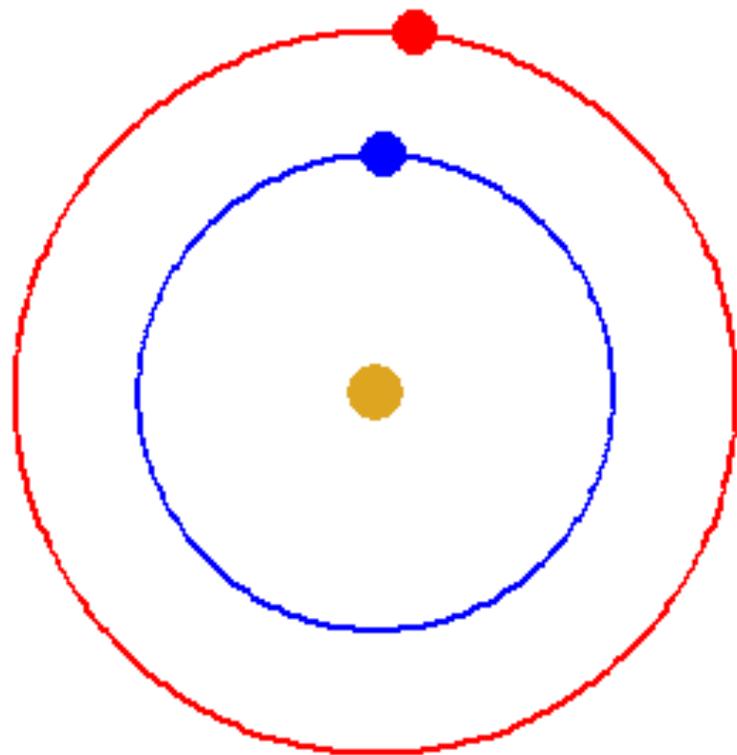

Distance to the inferior planets

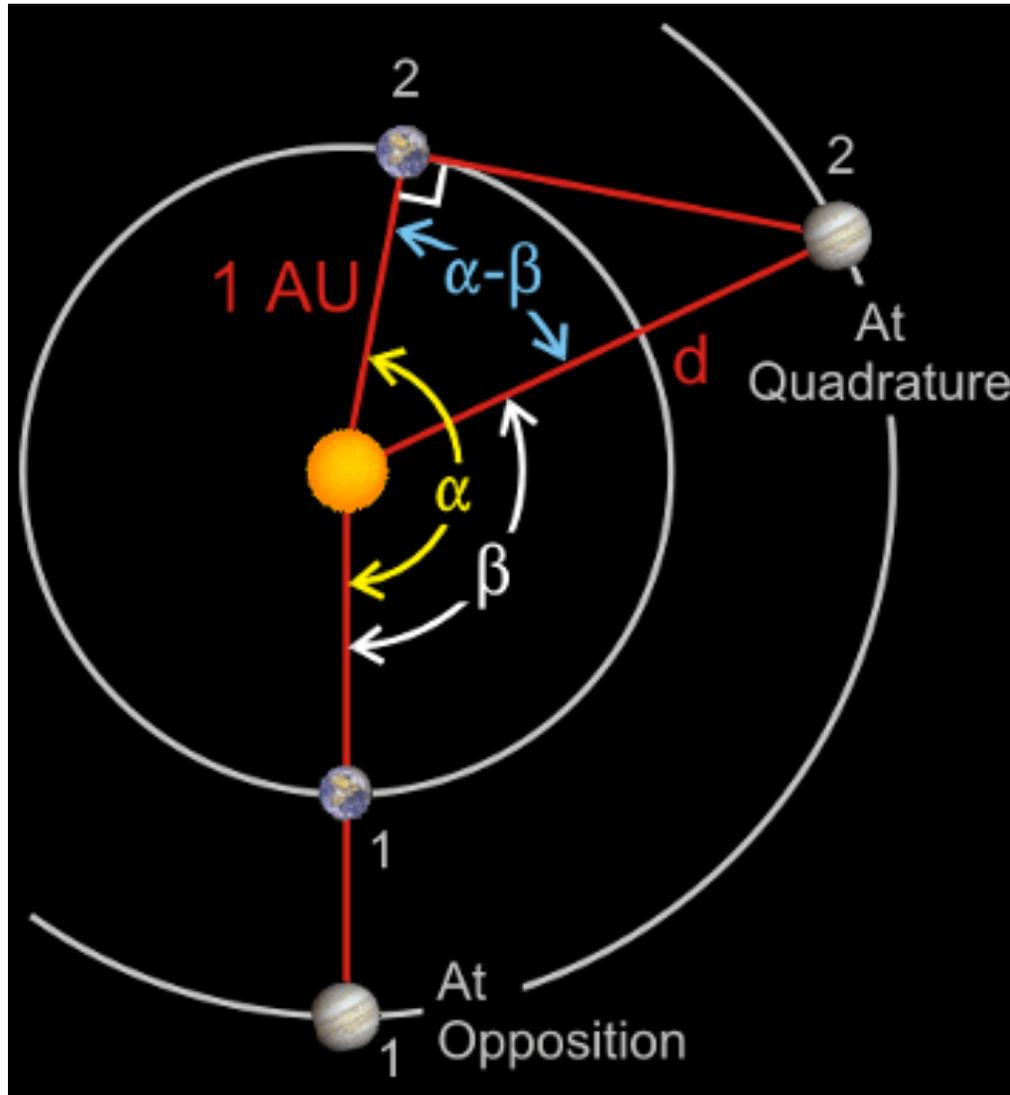

Superior planets : special points

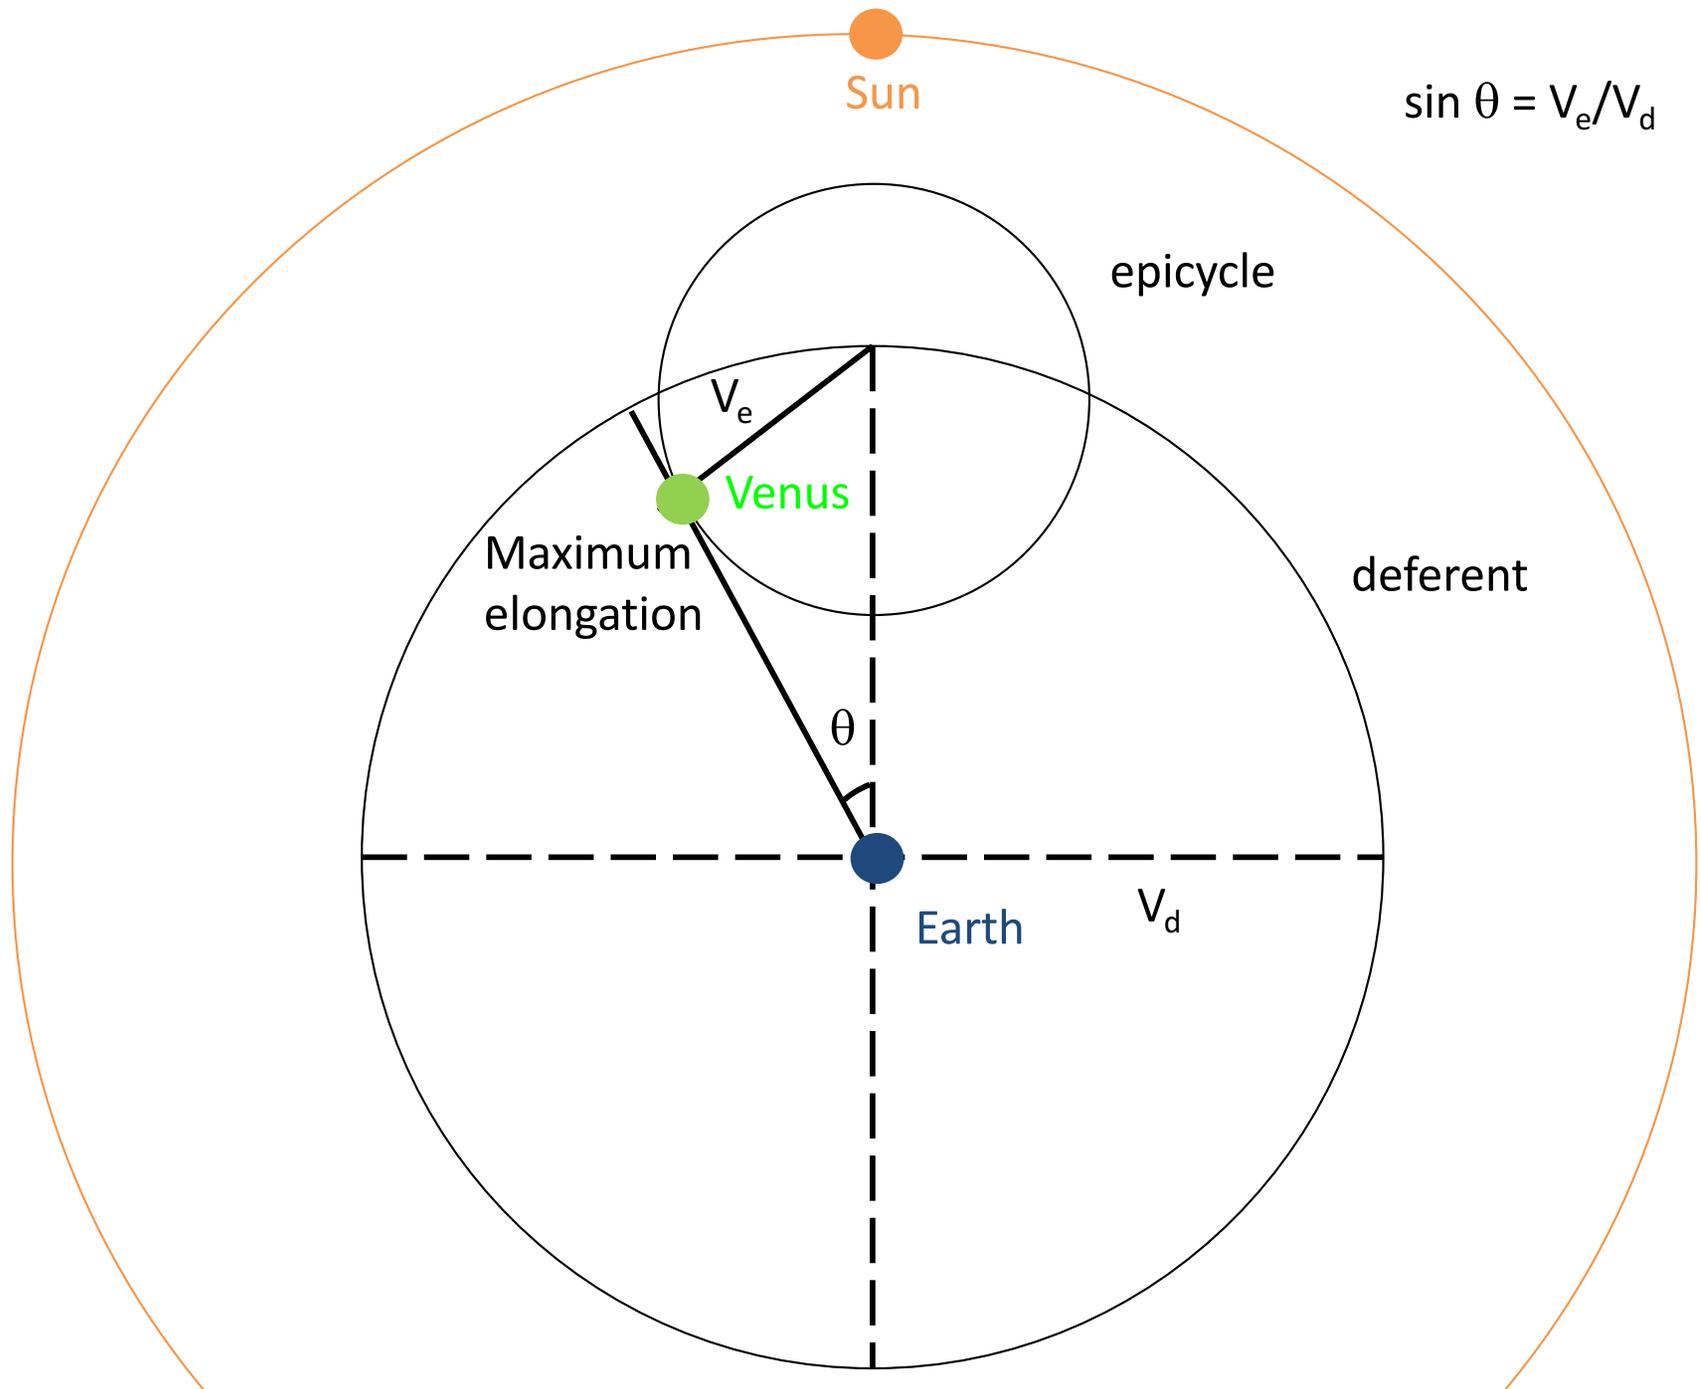

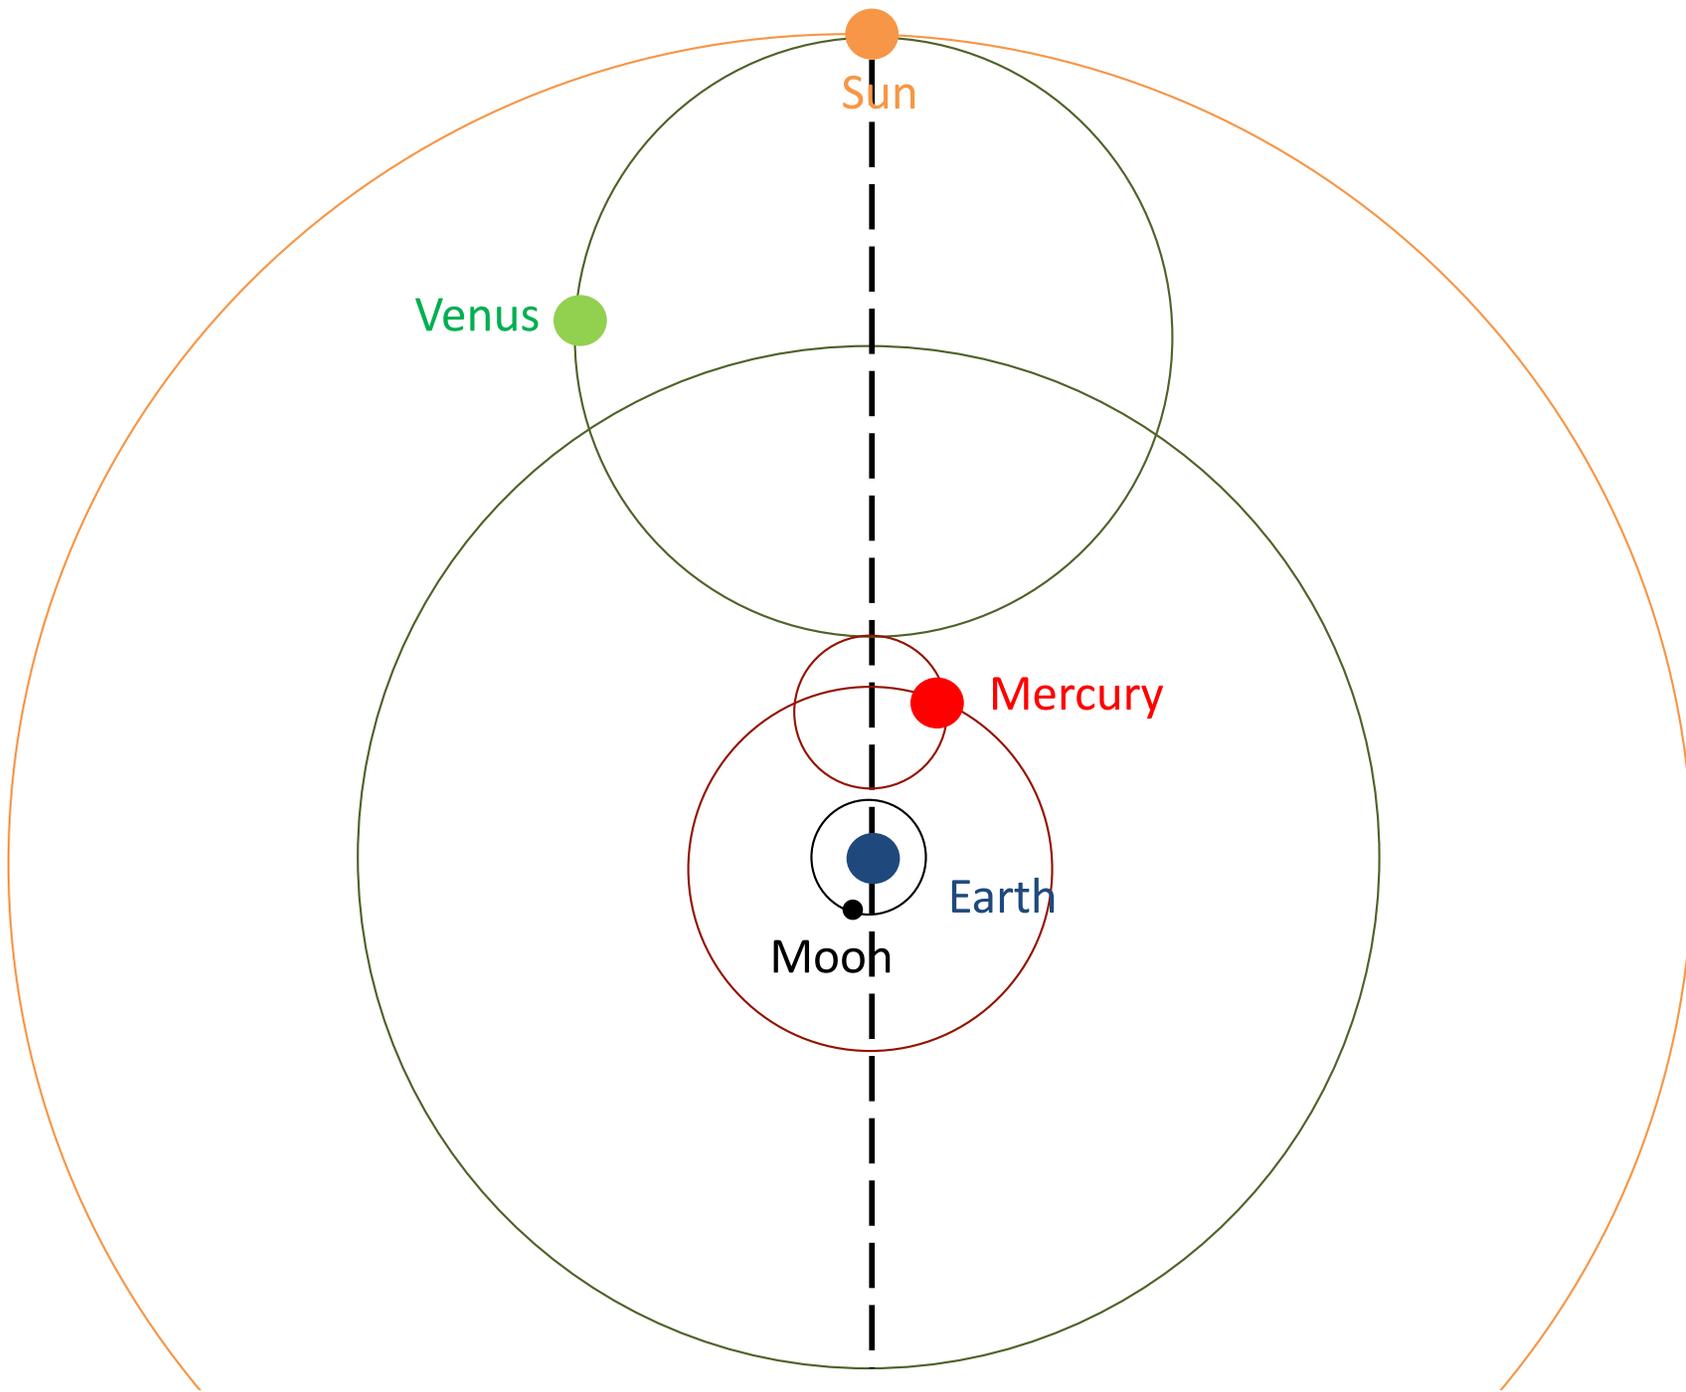

Distances to the superior planets

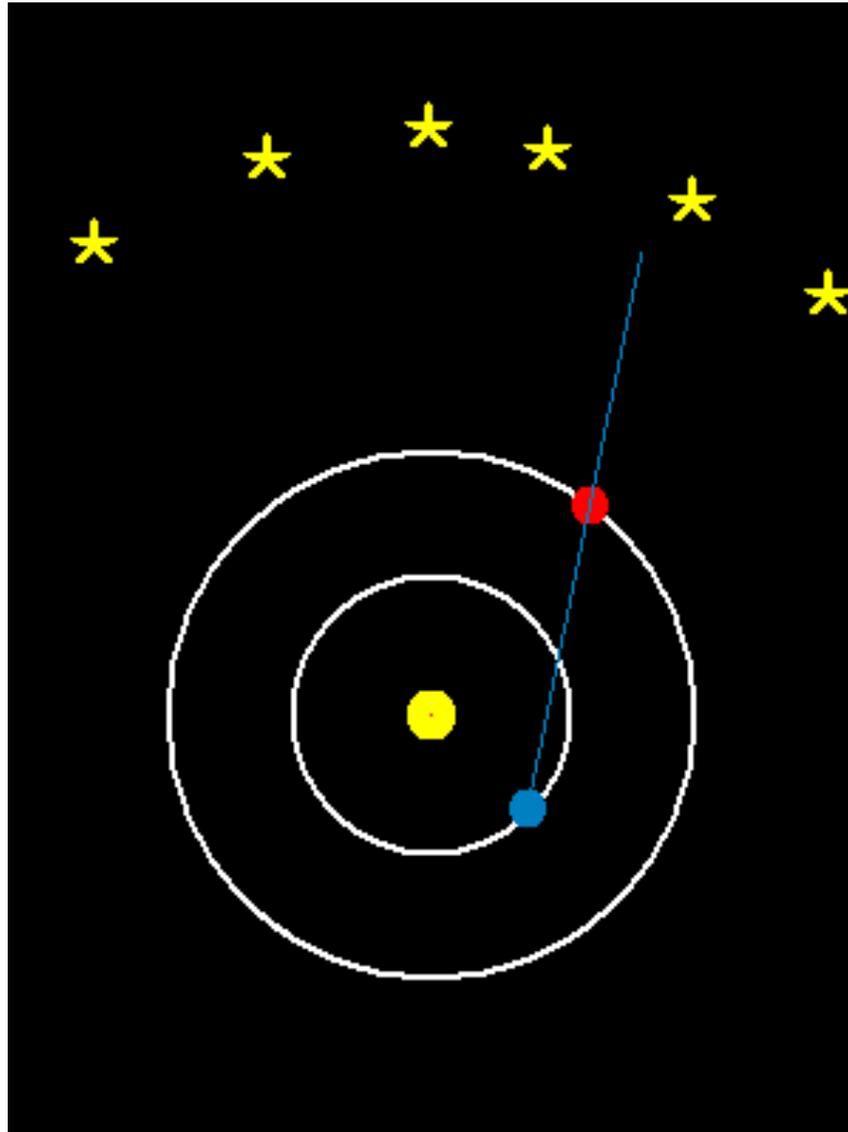

Distance to the inferior planets: Ptolemaic System

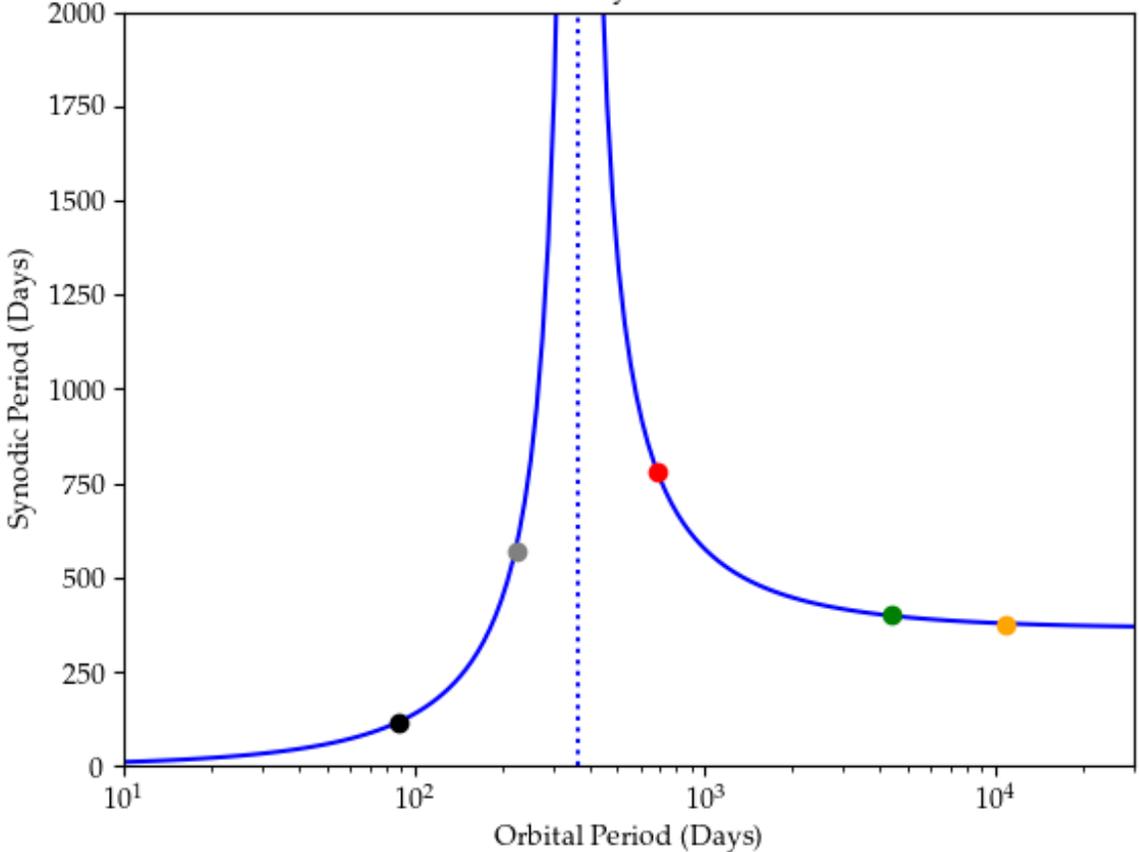

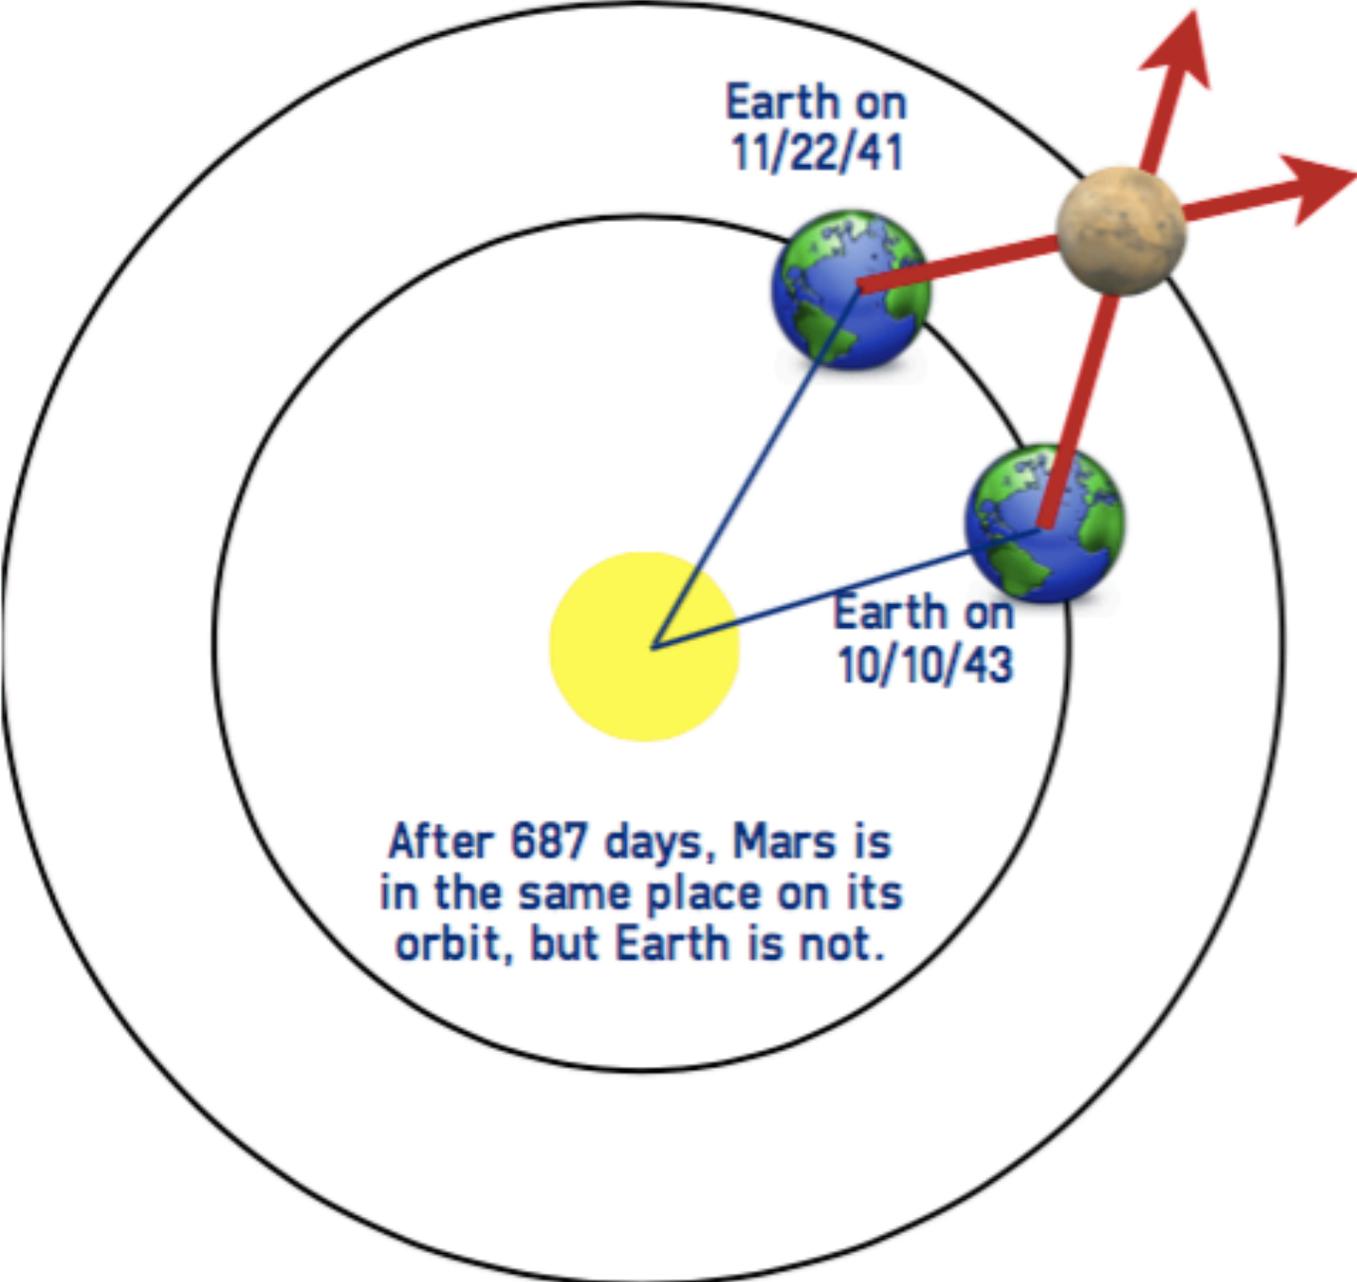

Retrograde Motion

Orbital vs Synodic Period

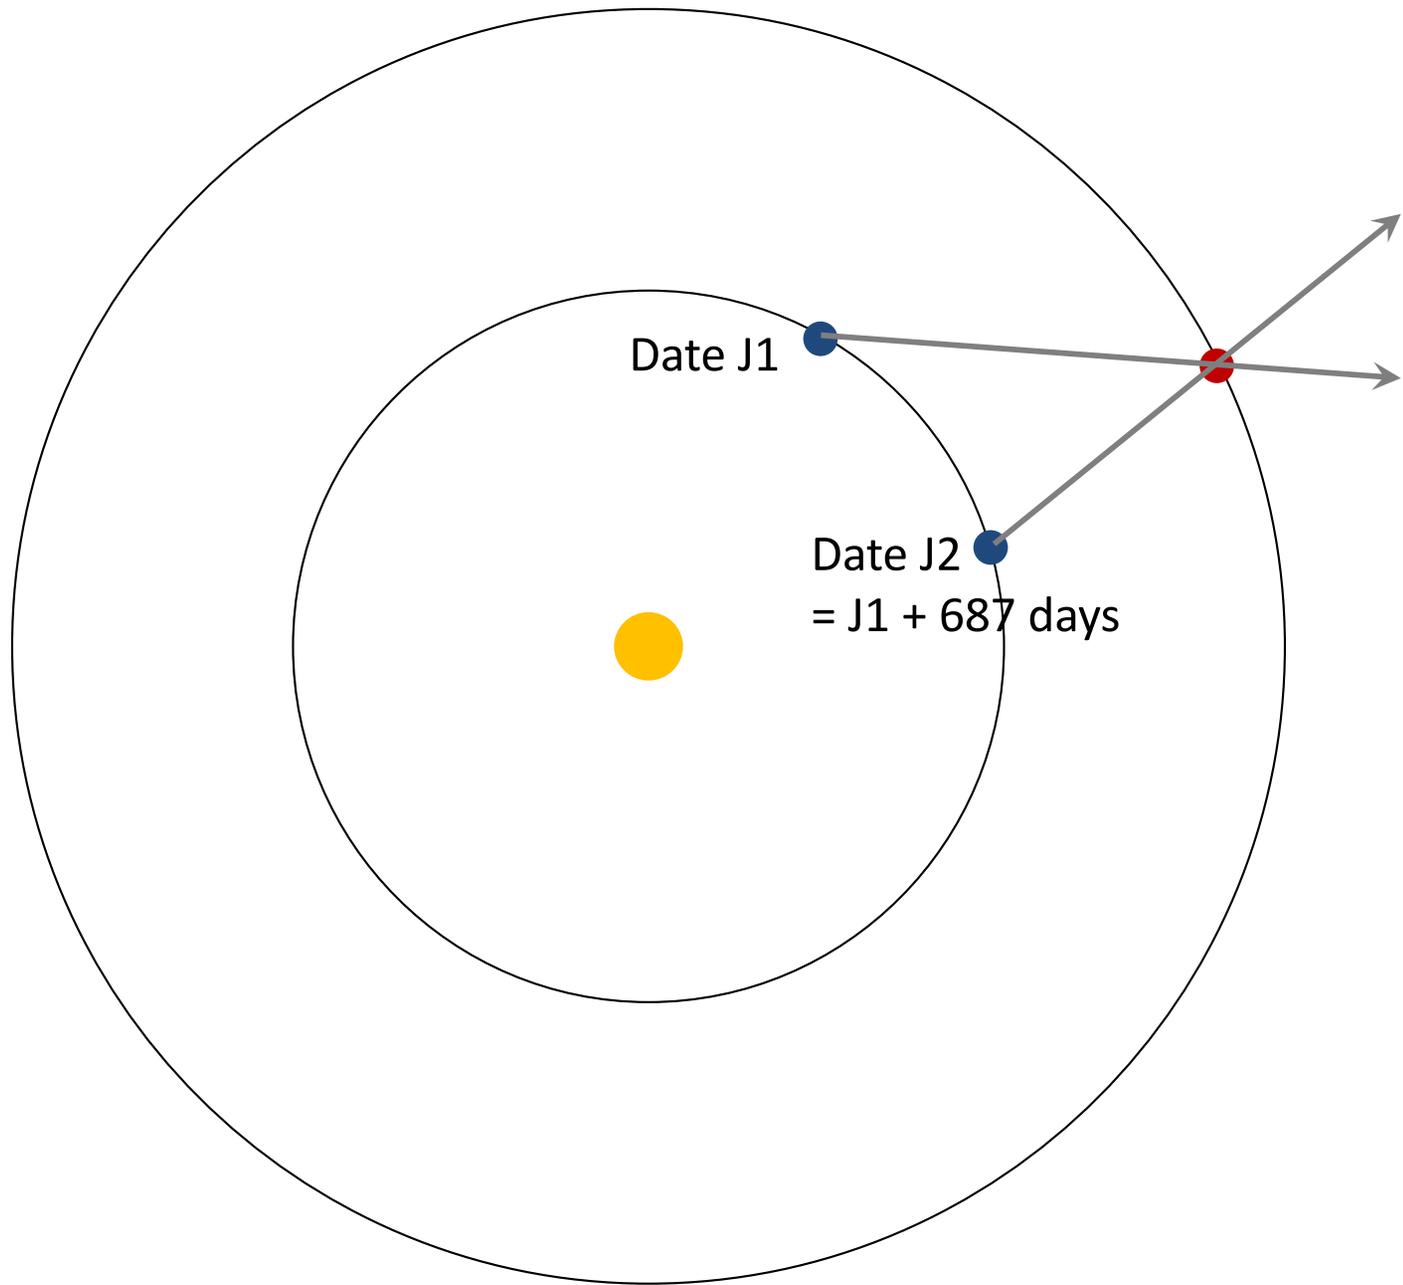

Constructing an Orbit

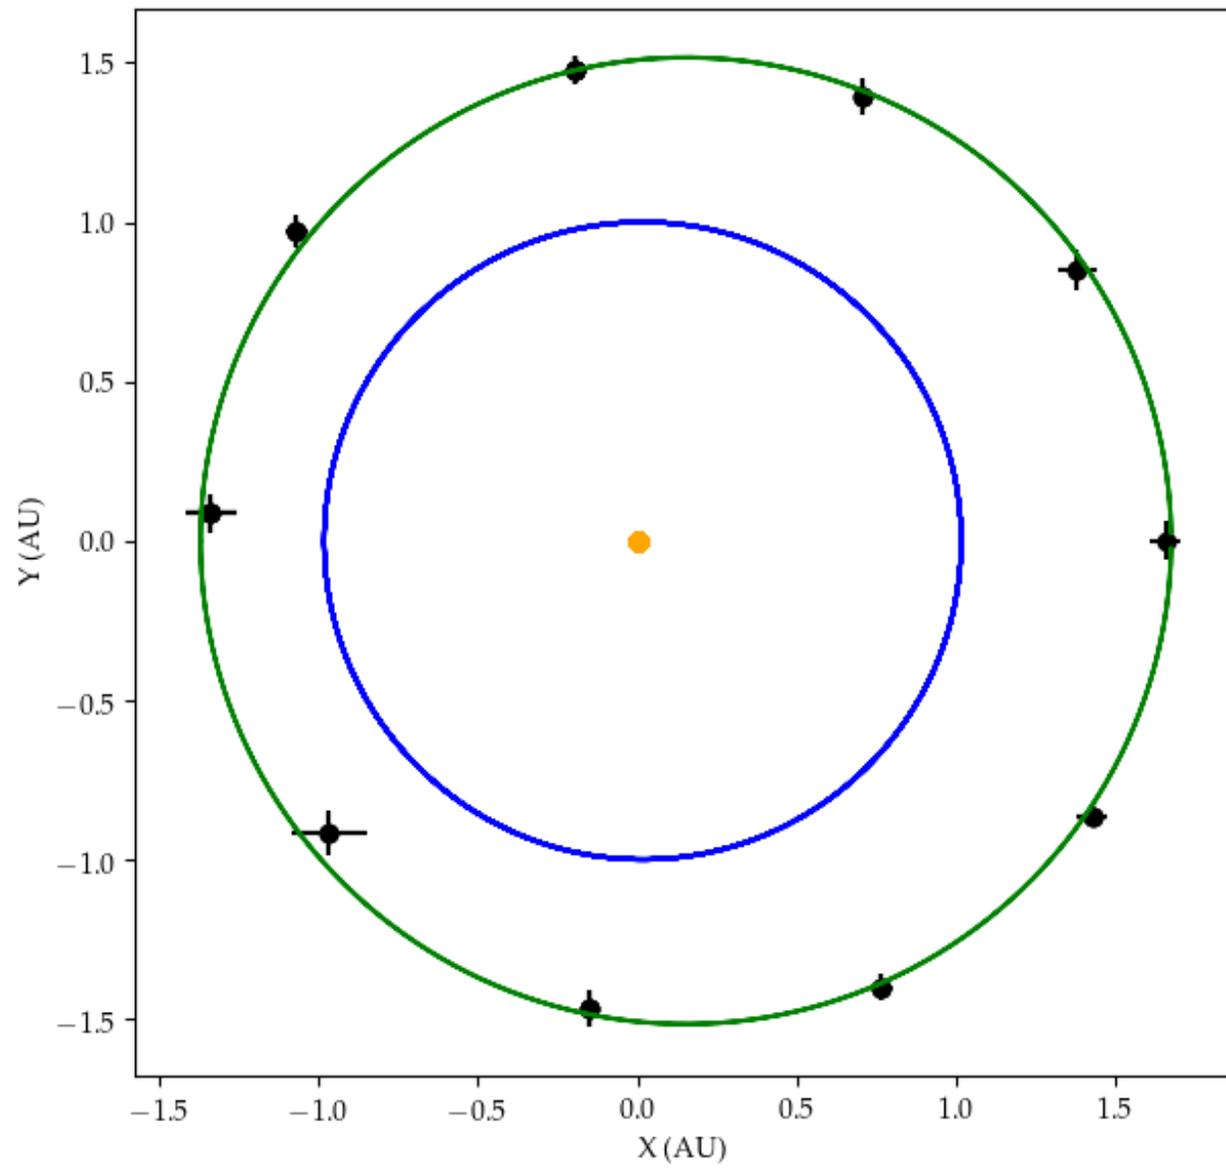

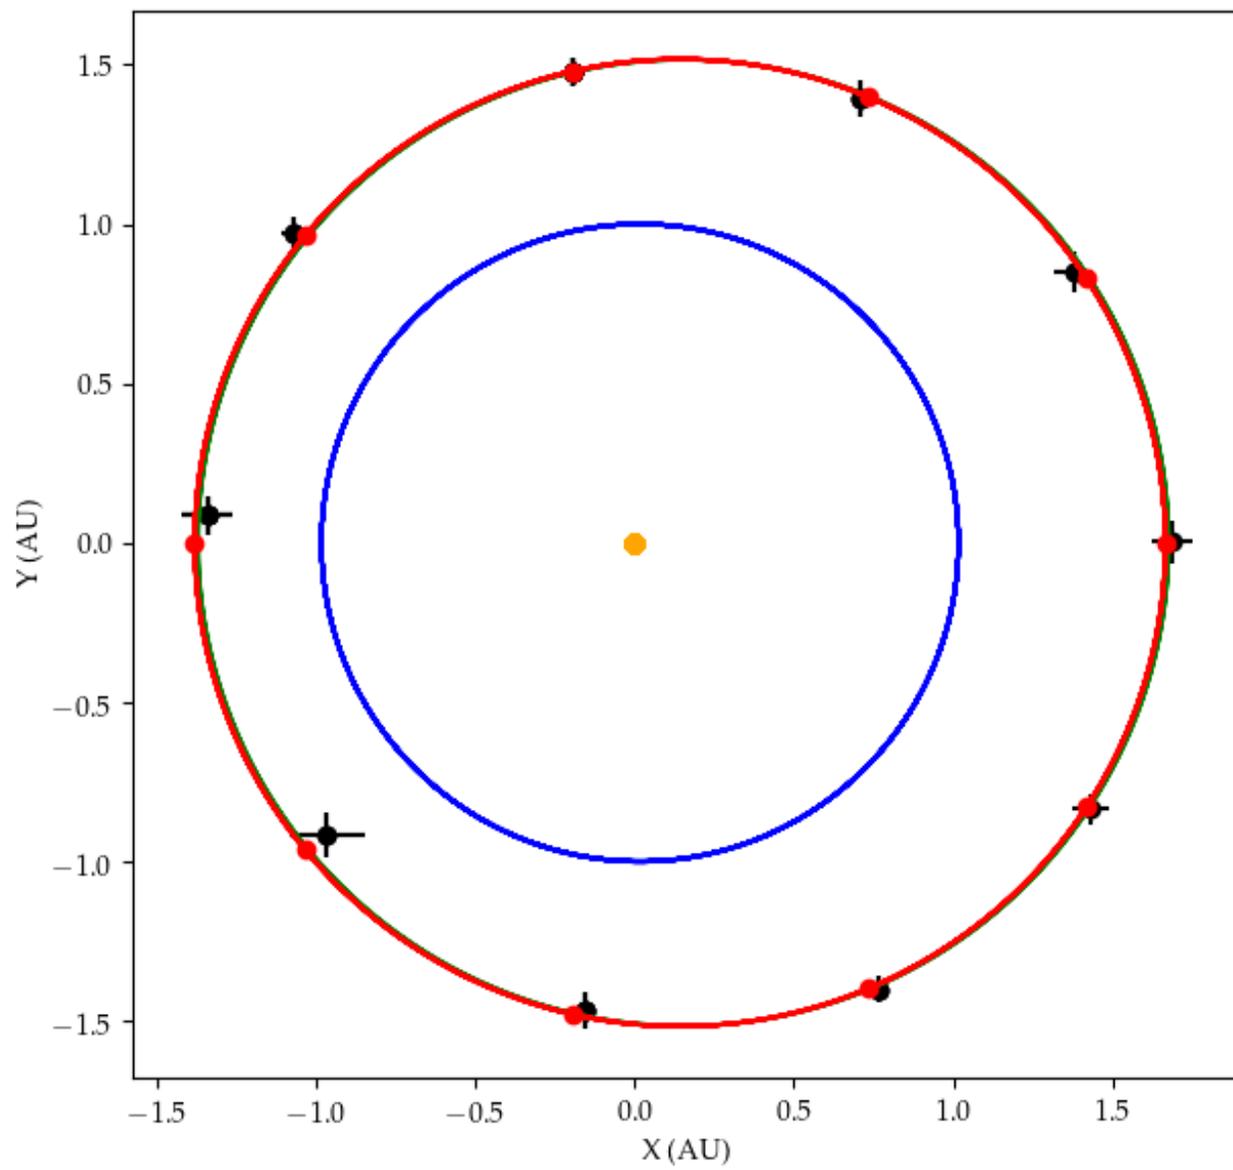

Earth on 11/22/41

Earth on 10/10/43

After 687 days, Mars is in the same place on its orbit, but Earth is not.

① inclination of planet

② helical/synodic anomaly
→ epicycle③ zodiacal/ecliptic
→ eccentric④ precession
- the movement of the
fixed stars, planets
(ADK) $1^{\circ}/100$ year

⑤ equant

planets. Next, we say that the whole plane [of the eccentre] moves uniformly about centre E towards the rear [i.e. in the order] of the signs, shifting the position of apogee and perigee 1° in 100 years, and that diameter LOM of the epicycle rotates uniformly about centre D, again towards the rear [i.e. in the order] of the signs, with a speed corresponding to the planet's return in longitude, and that it carries with it points L and M of the epicycle, and centre E of the epicycle (which always moves on the eccentre HOK), and also carries with it the planet; the planet, for its part, moves with uniform motion on the epicycle LM and performs its return always with respect to that diameter [of the epicycle] which points towards centre D, with a speed corresponding to the mean period of the synodic anomaly, and [a sense of rotation] such that its motion at the apogee L takes place towards the rear.

We can visualise the peculiar features of the hypothesis for Mercury as follows. Let [Fig. 9.2] the eccentre producing the anomaly be ABG about centre D, and let the diameter through D and centre E of the ecliptic be ADEC [passing] through the apogee at A. On AG take DZ towards the apogee A, equal to DE. Then everything else remains the same, namely the whole plane [revolving] about centre E, shifts the apogee towards the rear by the same amount as for the other planets, the epicycle is revolved uniformly about centre D towards the rear, as [here] by the line DB, and furthermore the planet moves on the epicycle in the same way as the others. But in this case the centre of the other eccentre, which is, again, equal in size to the first eccentre, and on which the epicycle centre is always located, is carried around point Z in the opposite sense to the motion of the epicycle, namely in advance [i.e. in the reverse order] of the signs, but uniformly and with the same speed as the epicycle, as [here] on the line ZHO. Thus in one year each of the lines DB and ZHO performs 0

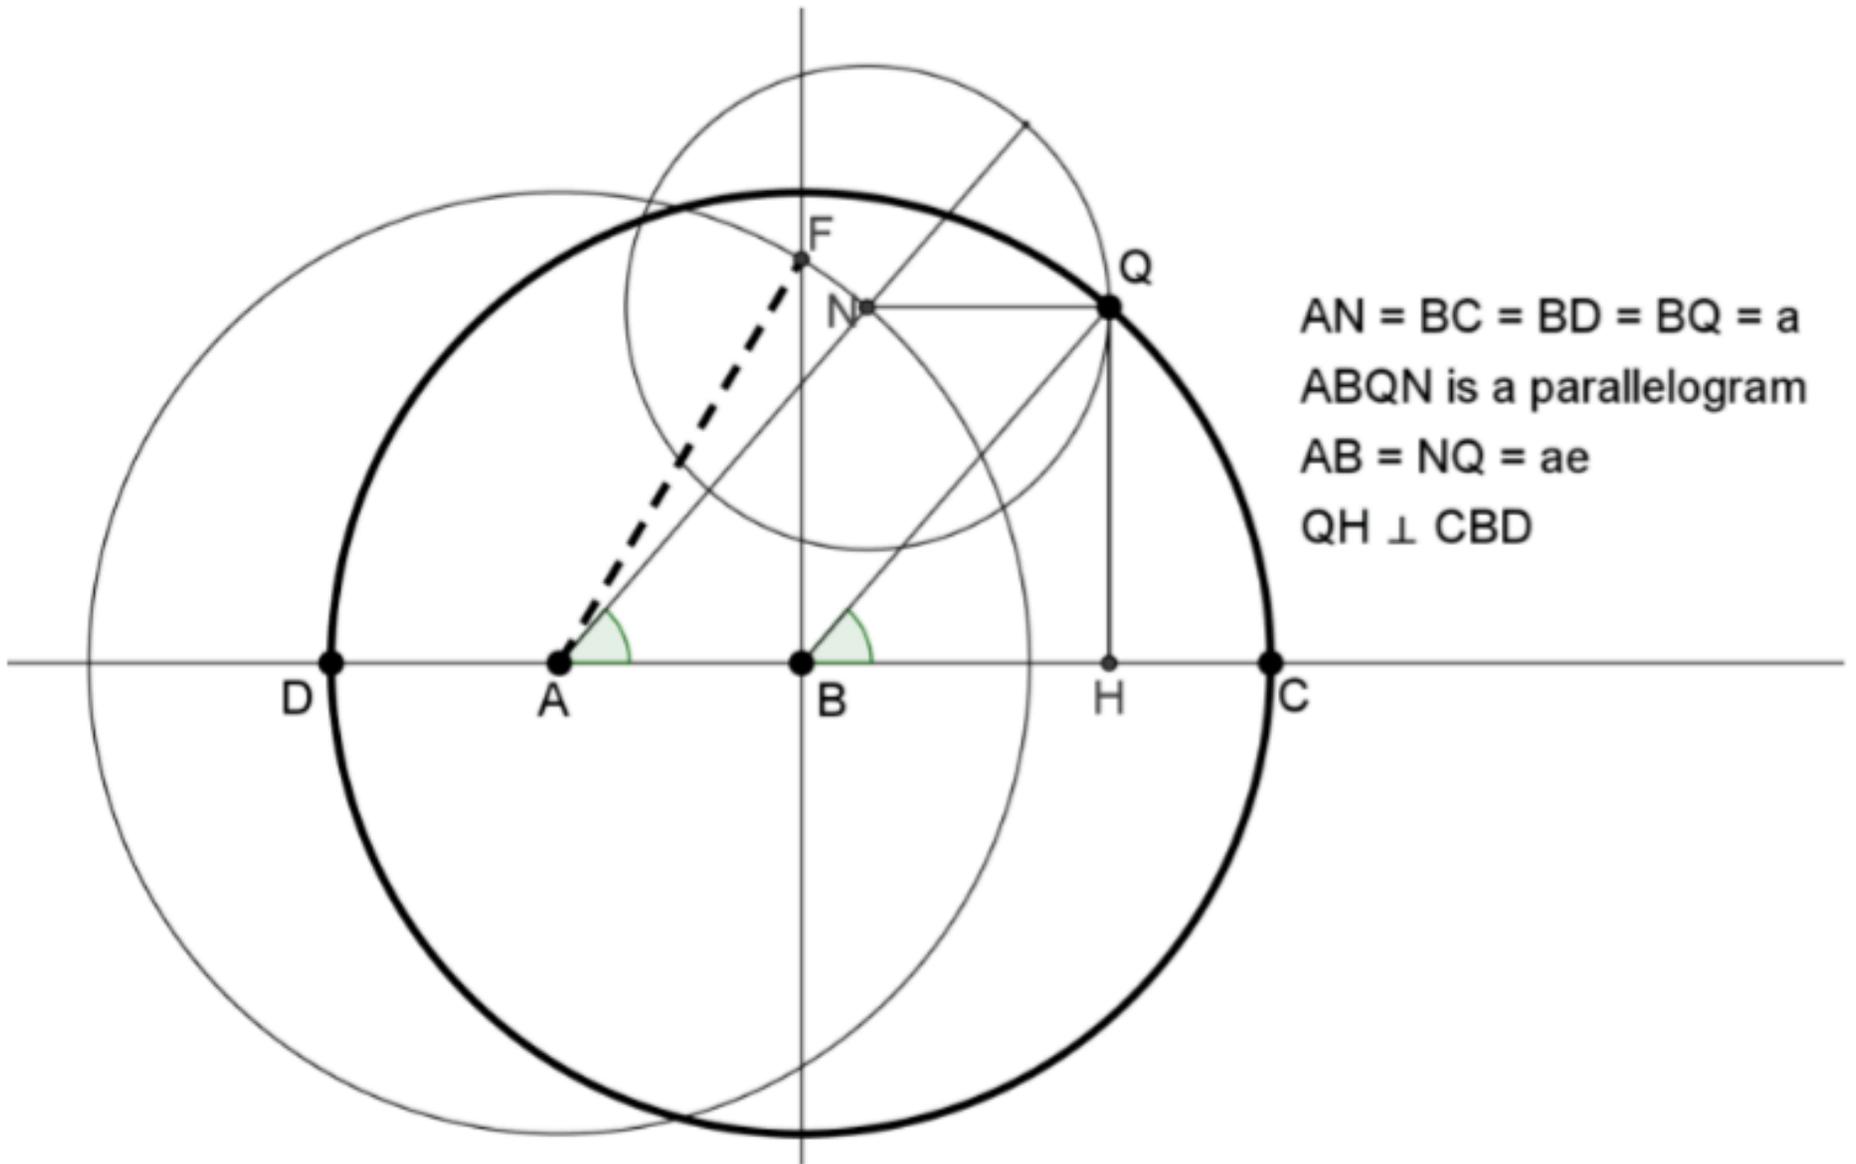

D – Equant
 E – Centre of ecliptic (Earth)

A – apogee
 G – perigee

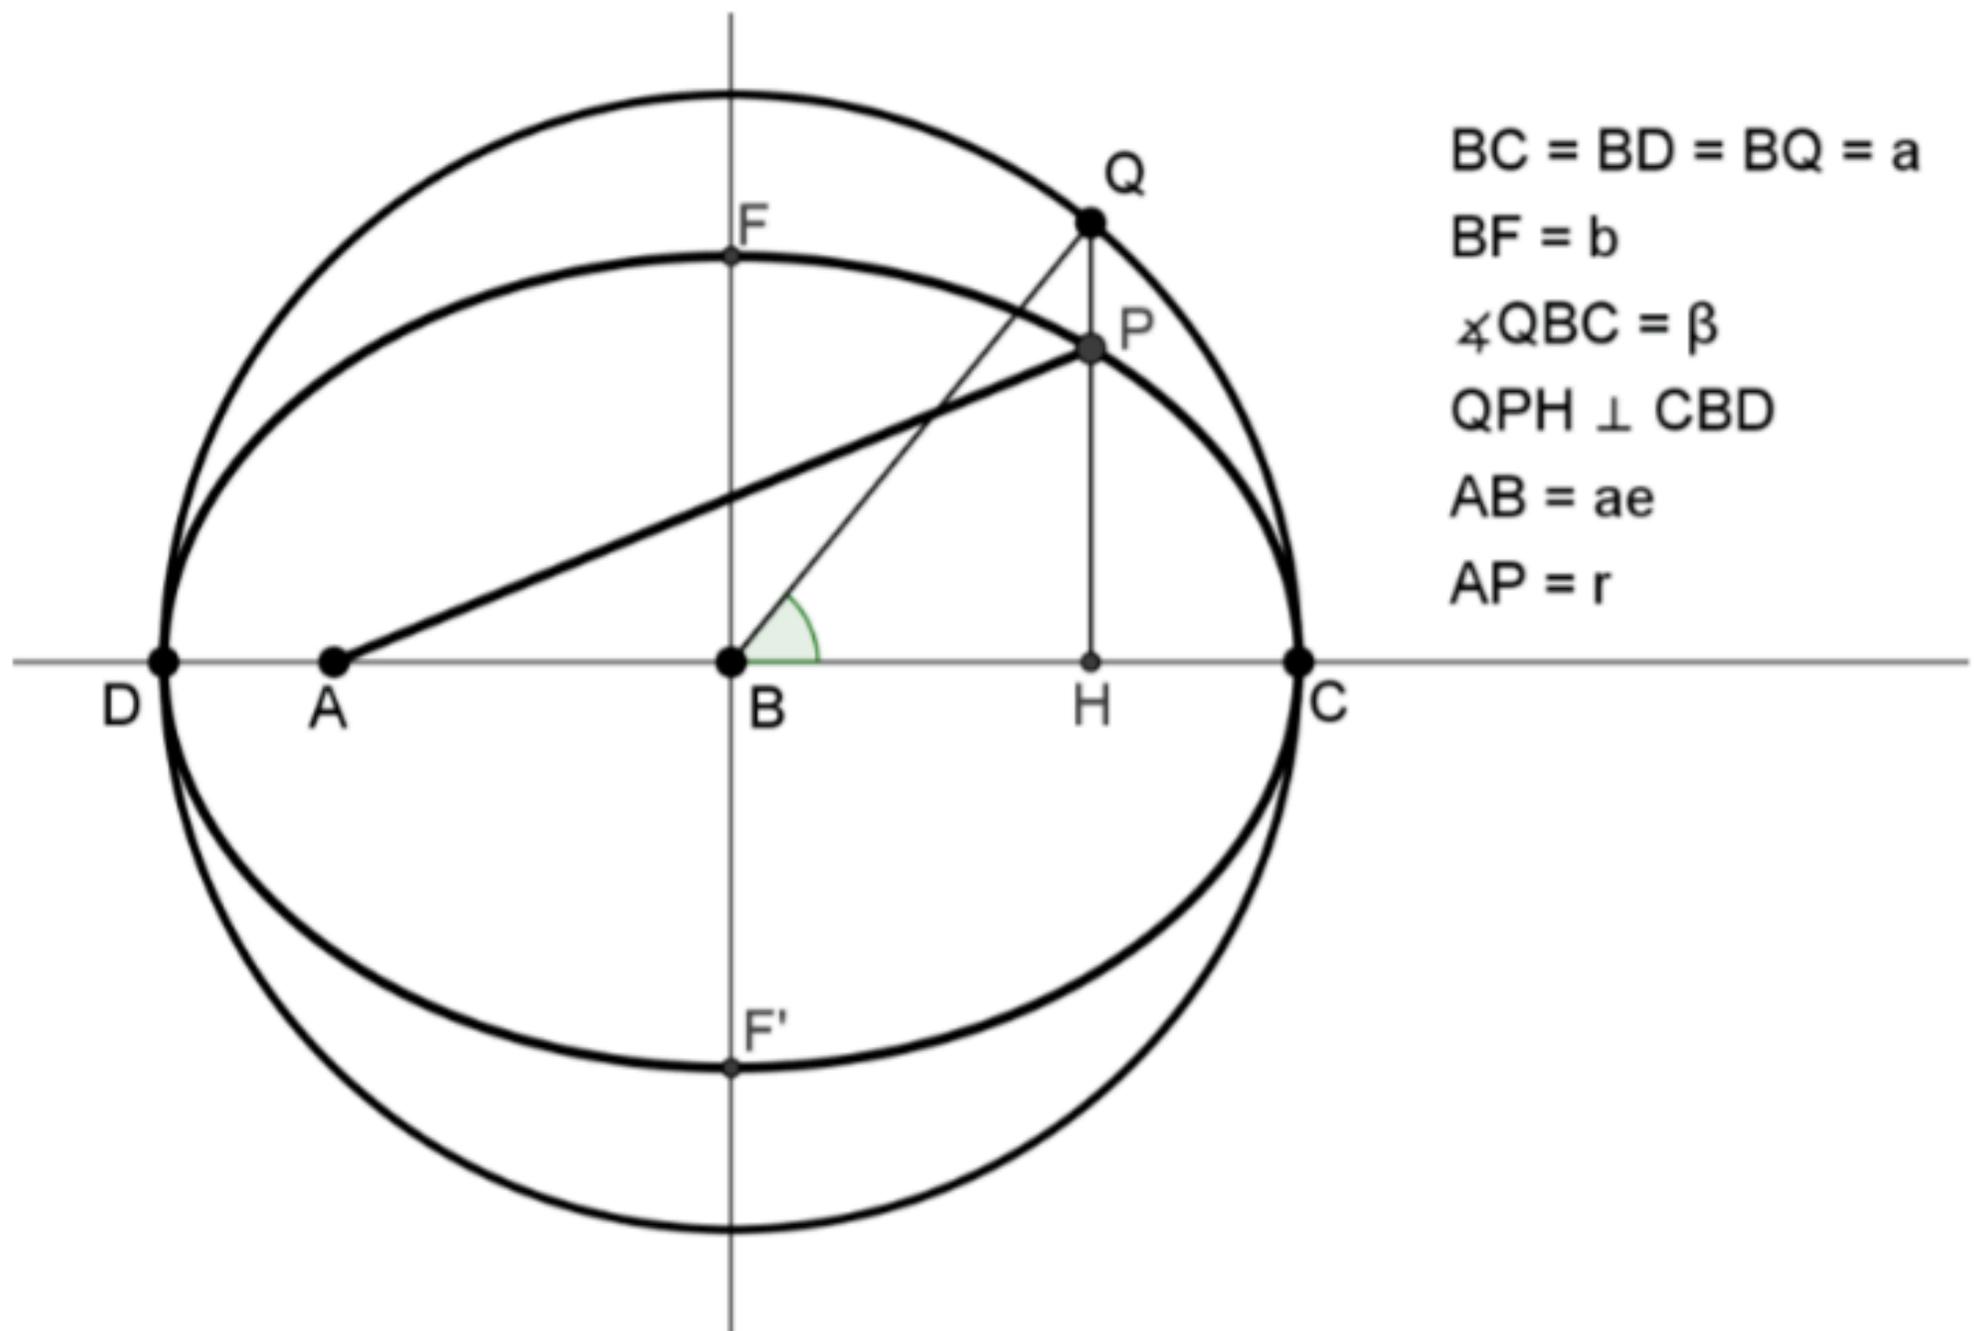

H⊙K – deferent
 ABG – eccentre

Fig. 9.1

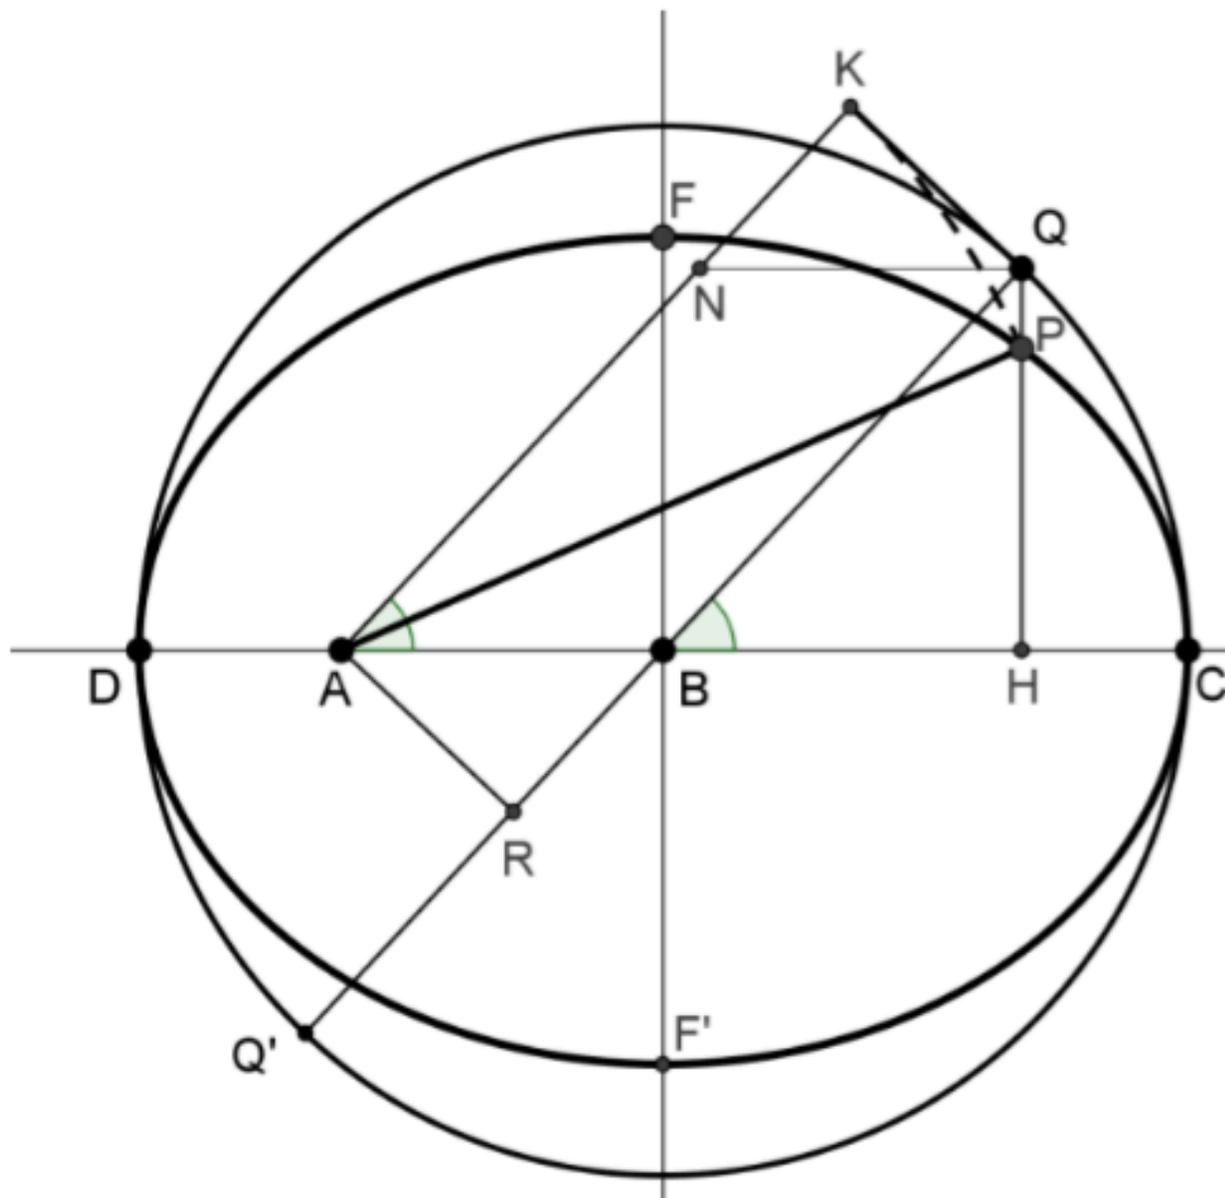

$AN = BC = BD = BQ = a$
 $ABQN$ is a parallelogram
 $AB = NQ = ae$
 $QH \perp CBD$

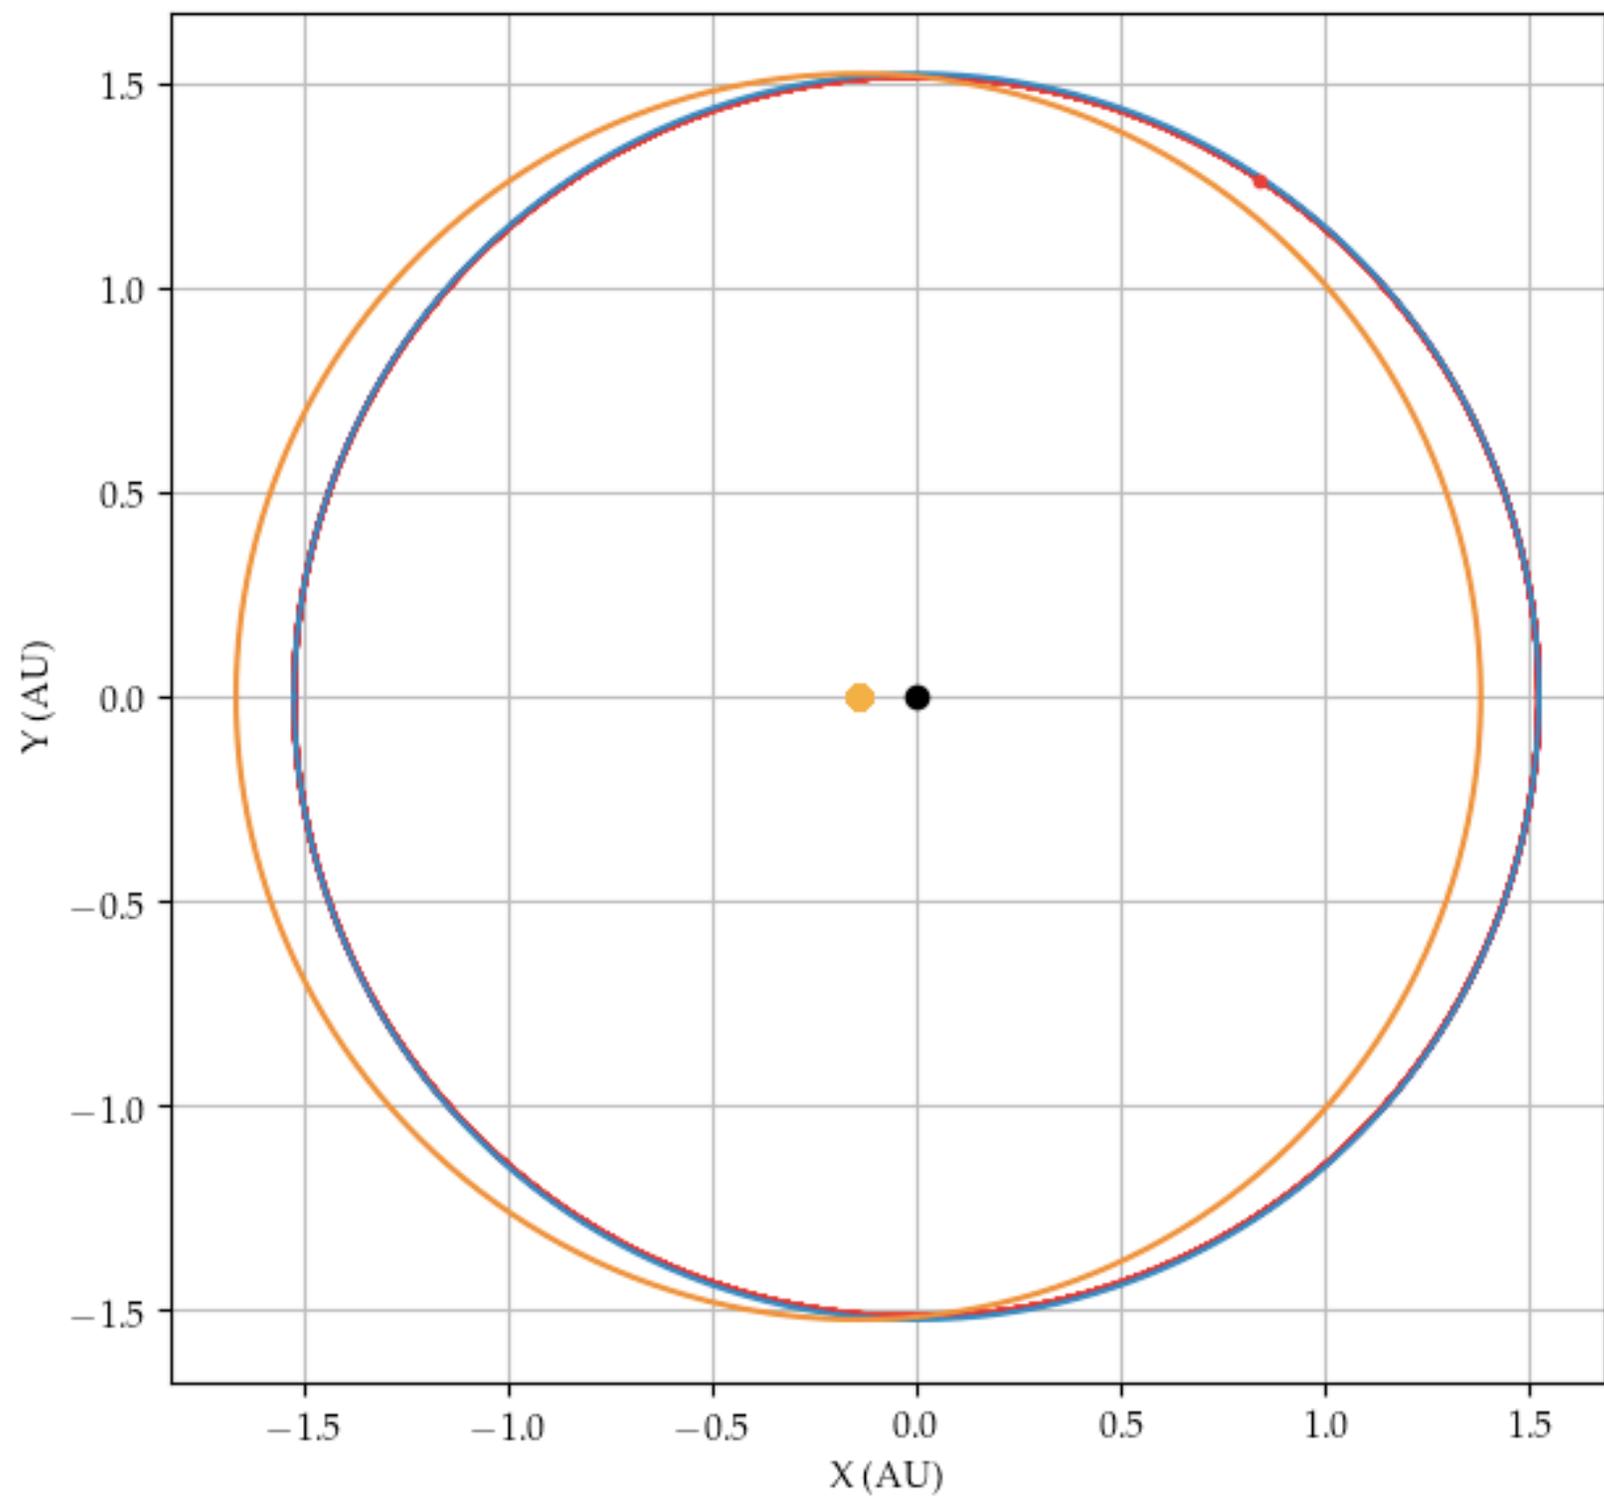

$$AB = ae = \frac{1}{2}(CA - DA).$$

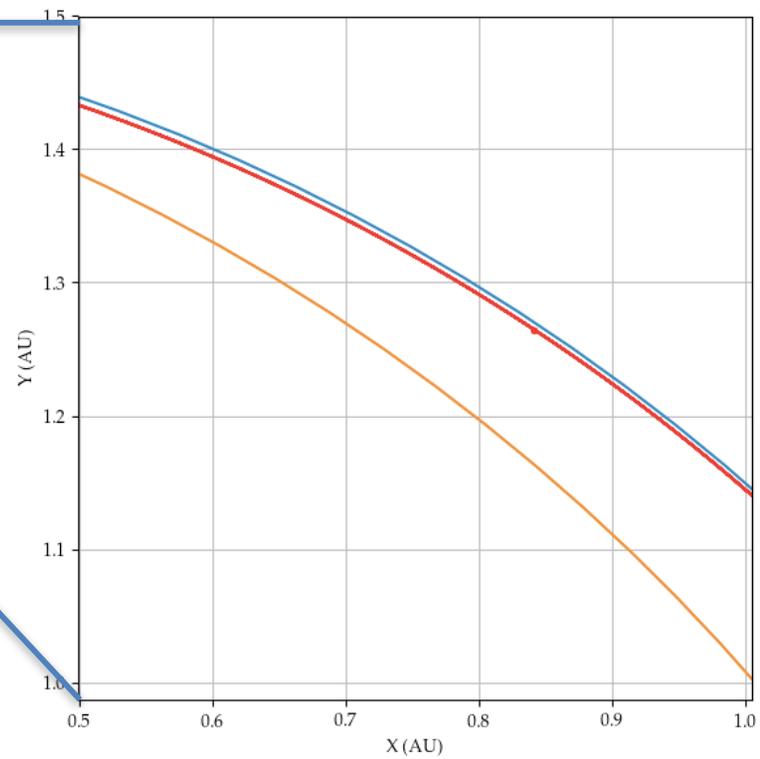

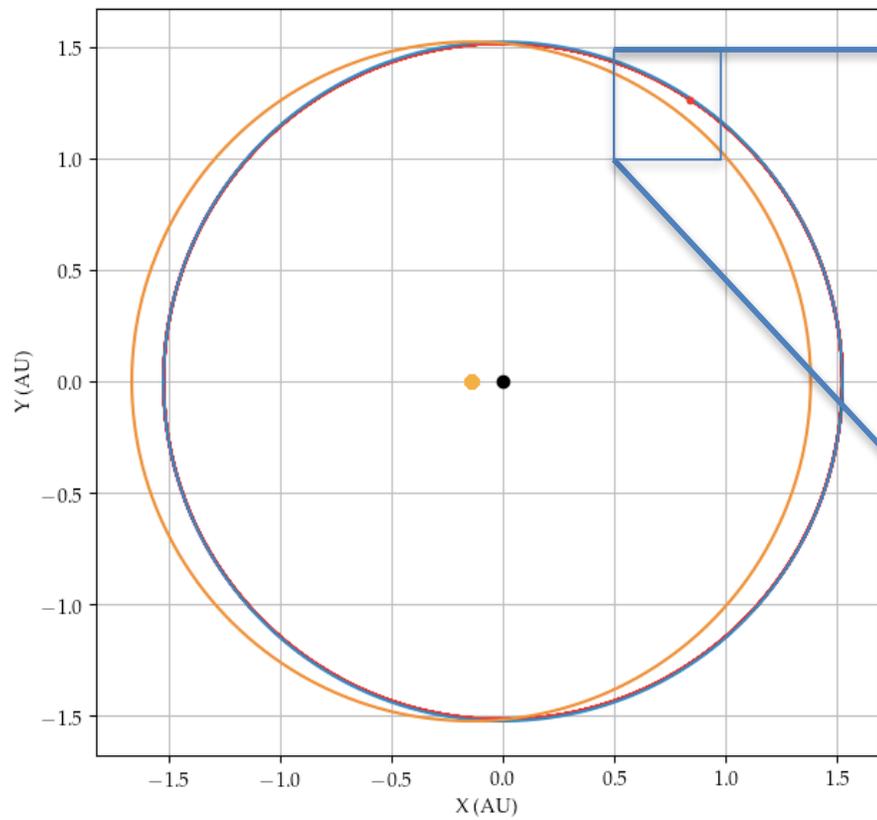

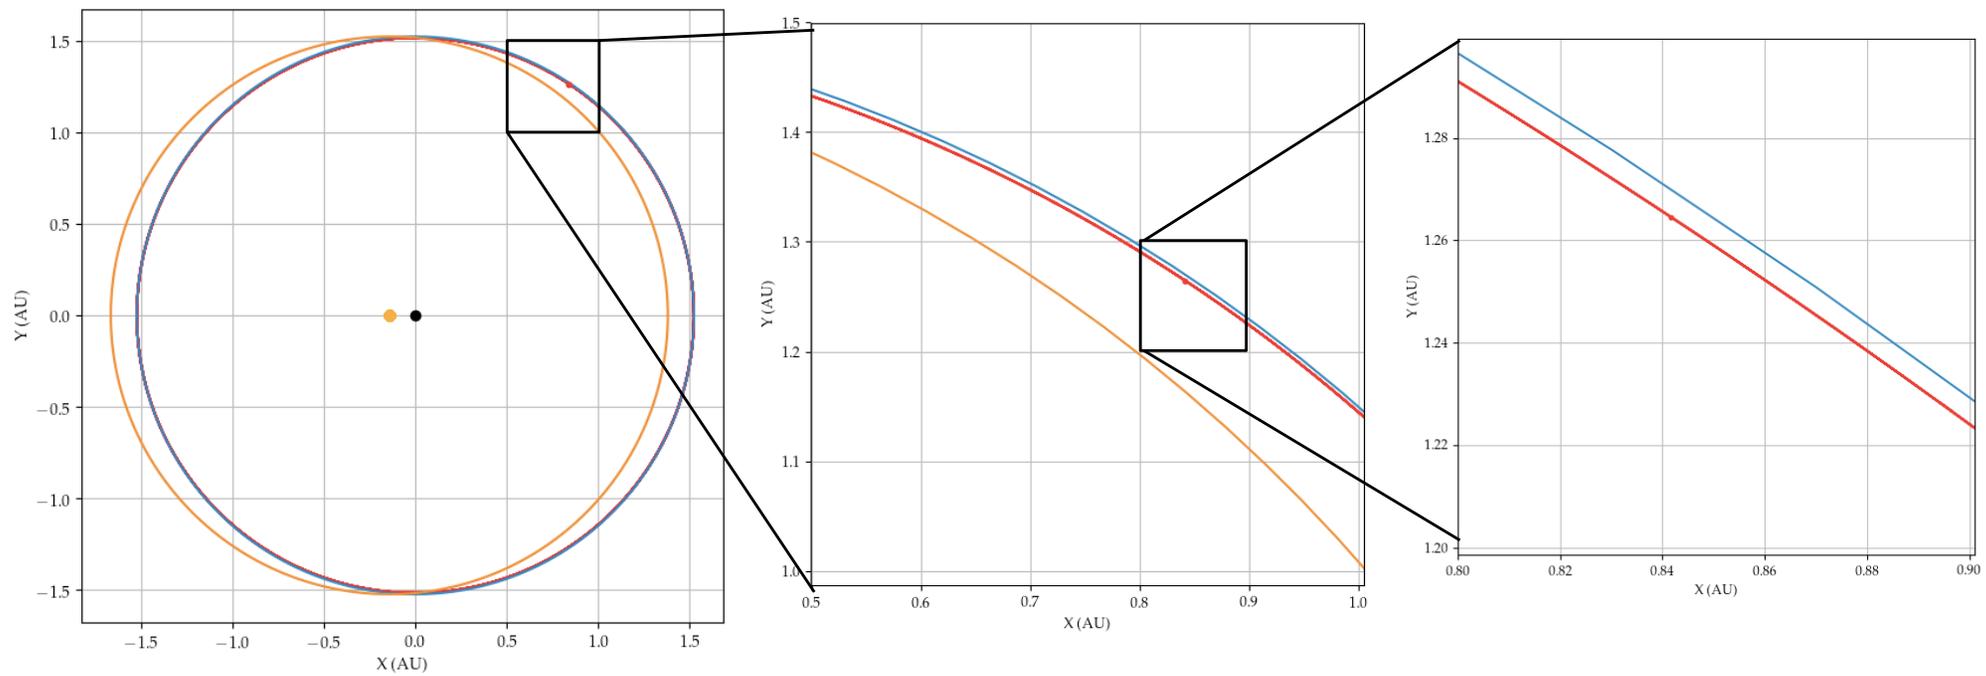

- $BC = BD = BQ = a$
- $BF = b$
- $\angle QBC = \beta$
- $QPH \perp CBD$
- $AB = ae$
- $AP = r$

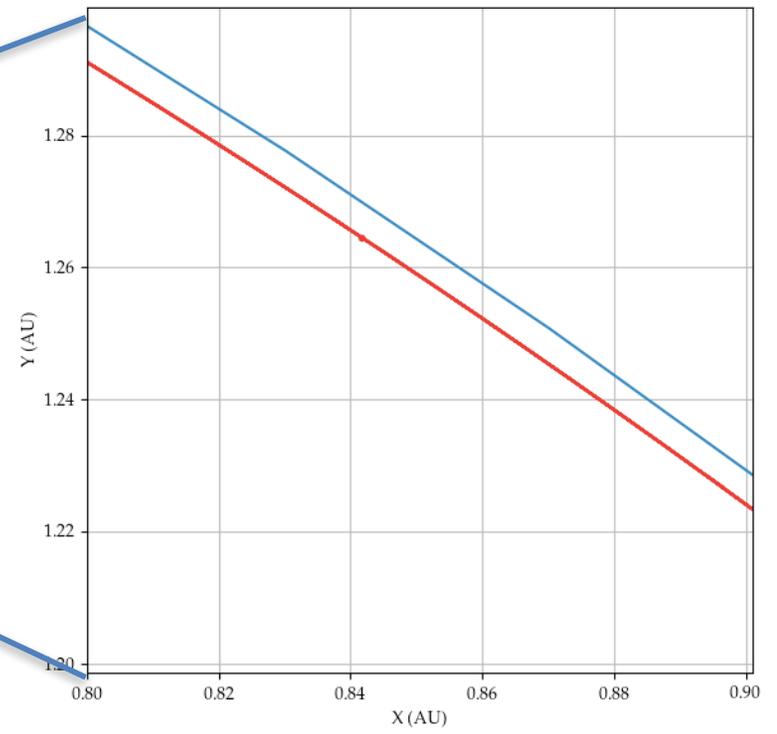

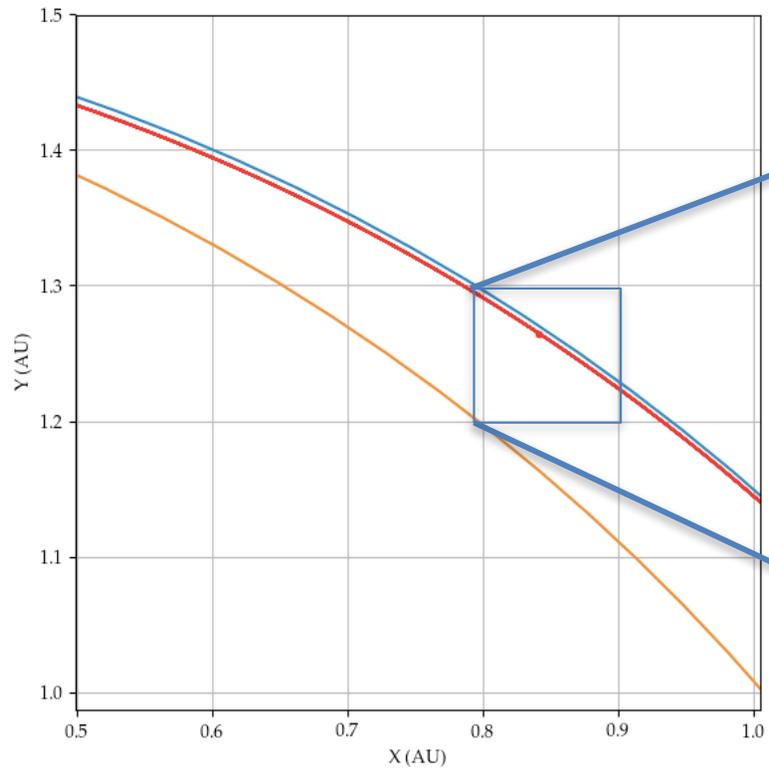

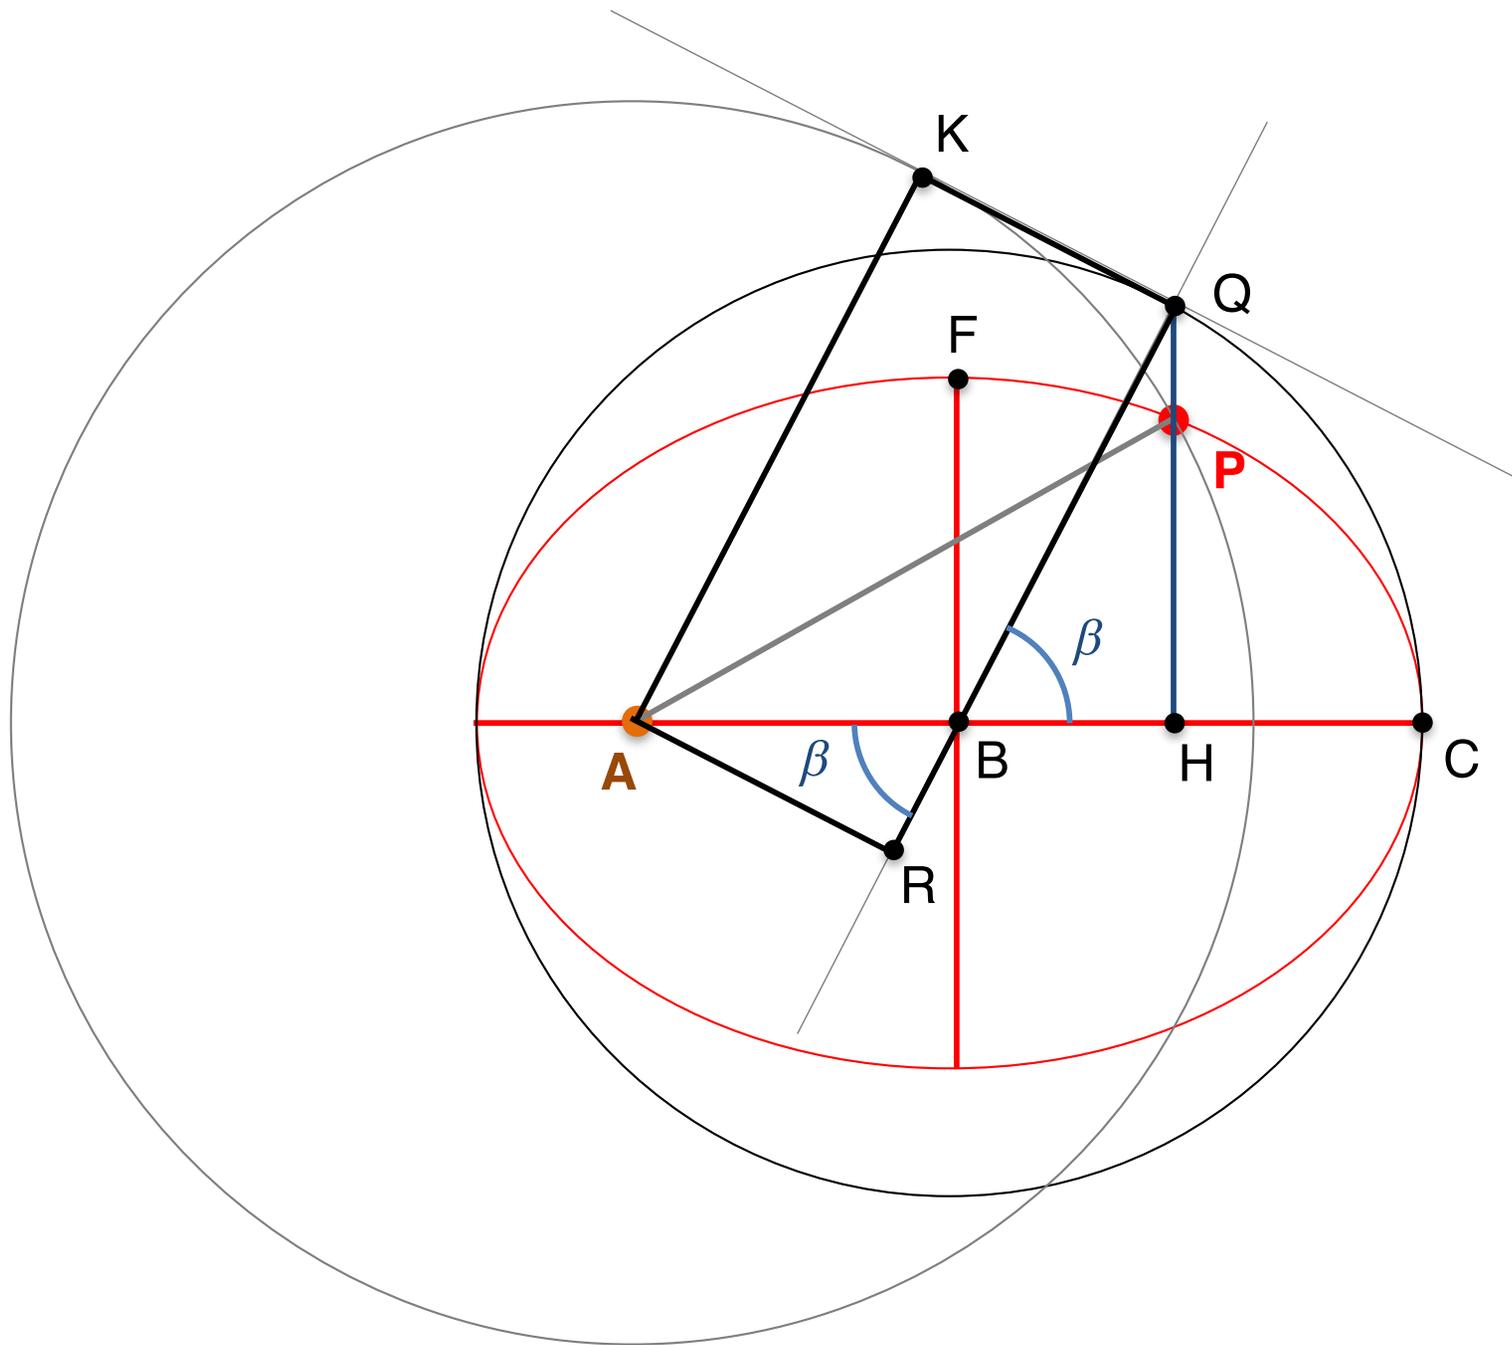

- $BC = BD = BQ = a$
- $ABQN$ is a parallelogram
- $BF = b$
- $\angle QBC = \beta$
- $QPH \perp CBD$
- $ANK \parallel QQ'$
- $KQ \perp QQ', AR \perp QQ'$
- $AB = ae$
- $AP = r$

Best fit
($e_{Eq} = e_{Sun}$)

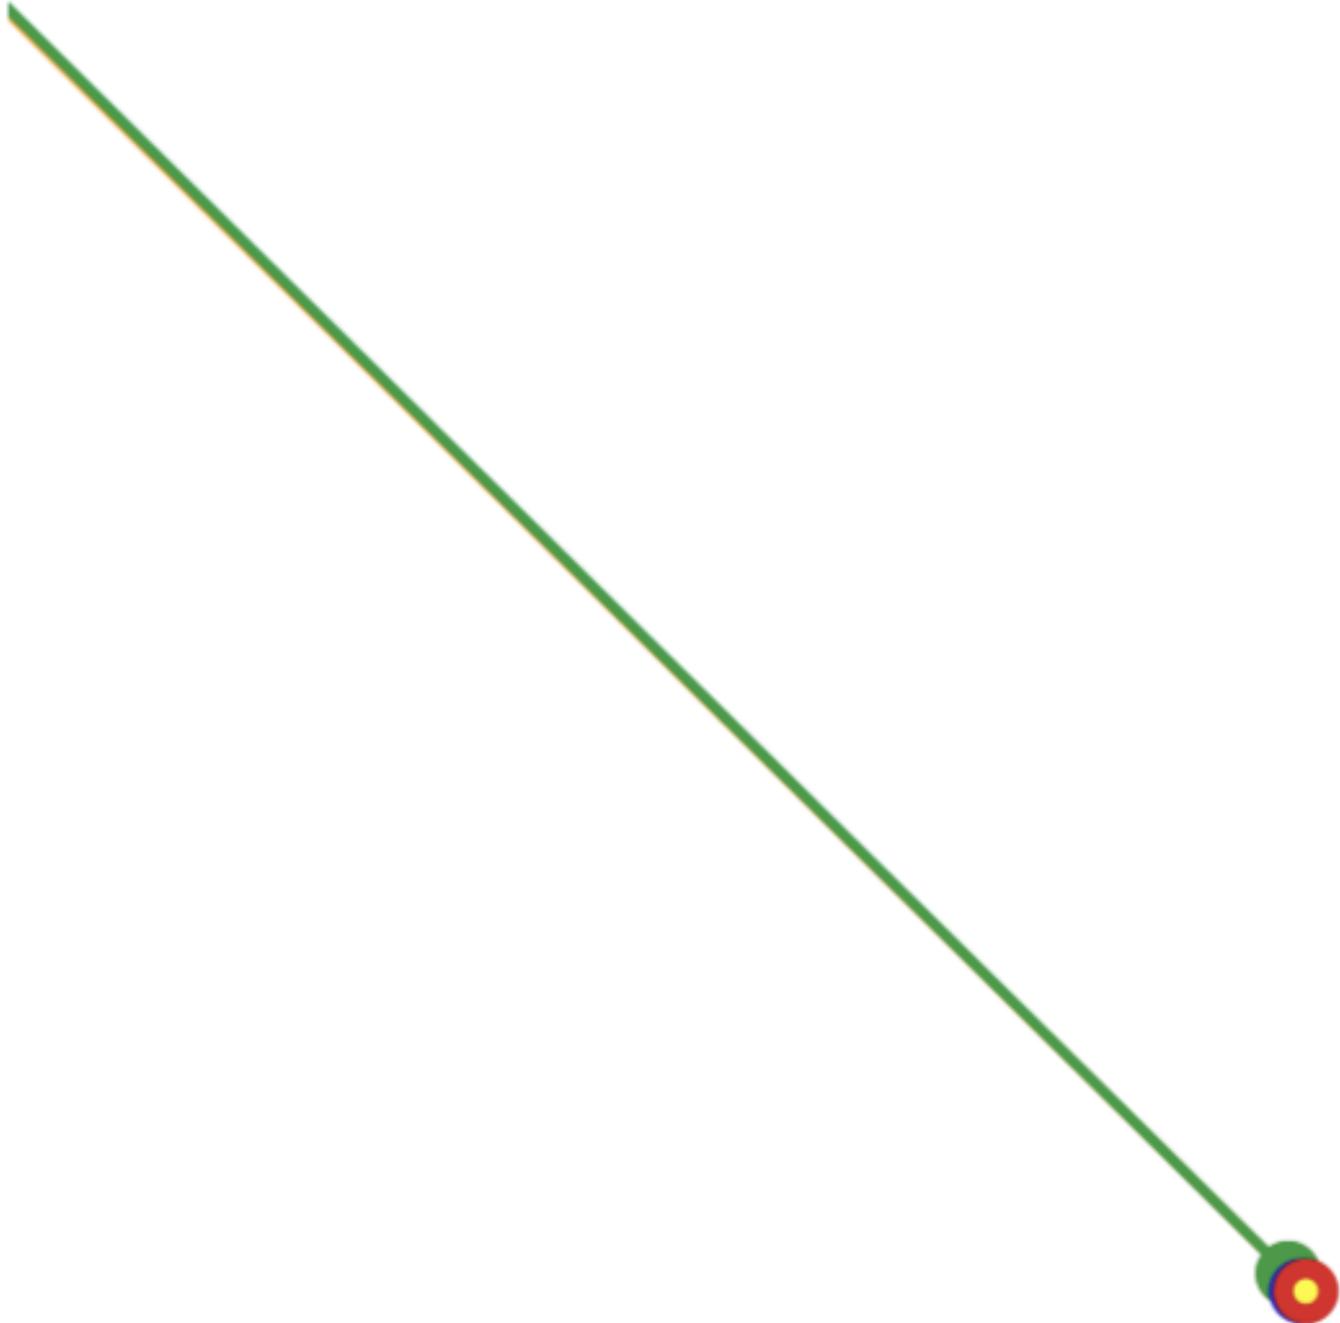

How big is the difference?

How big is the difference?

8 arcmin

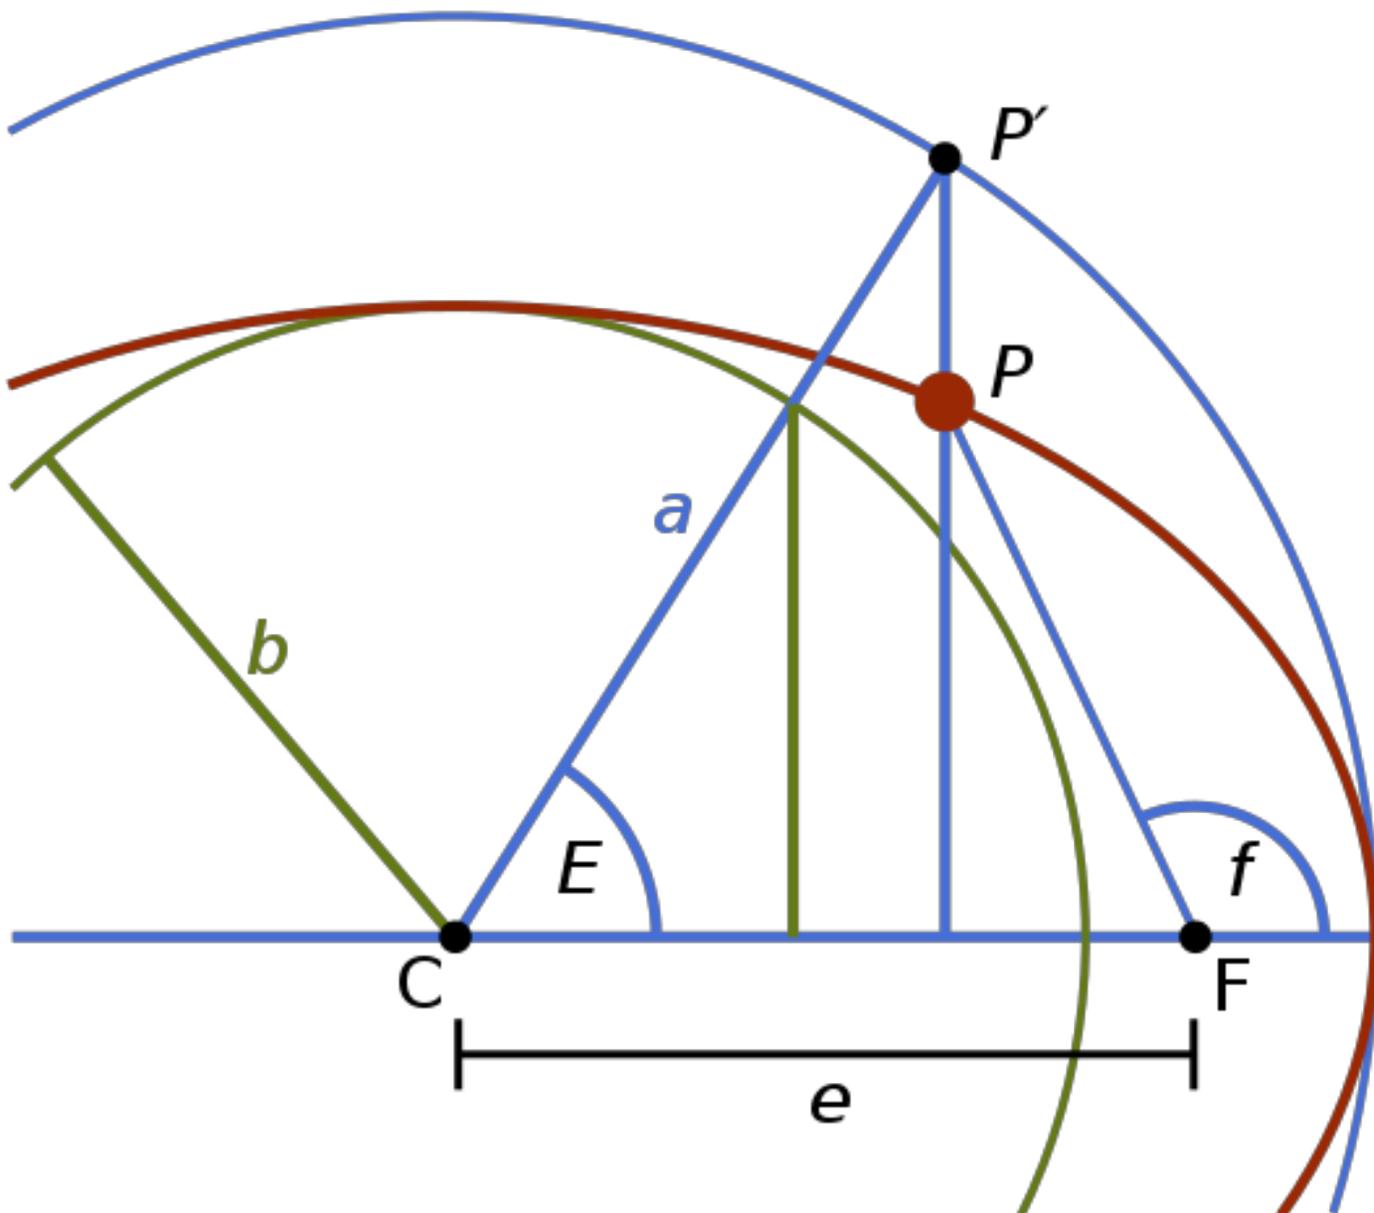

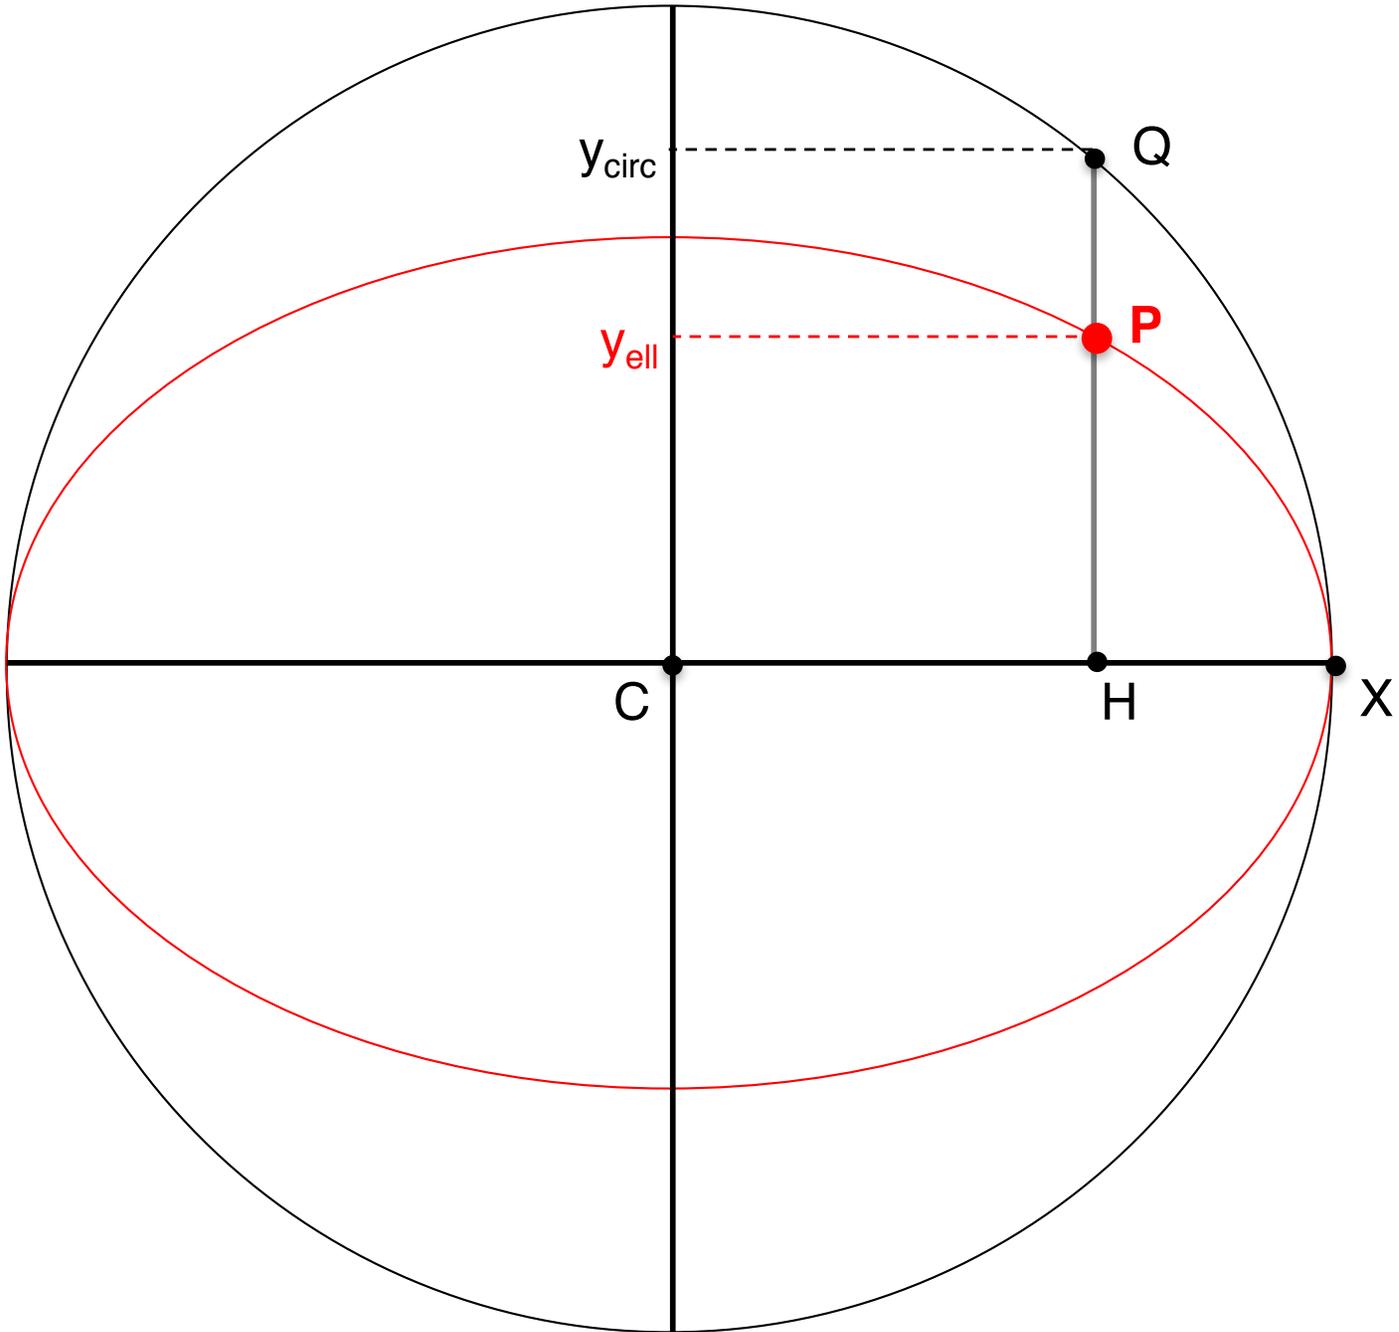

“If I had believed that we could ignore these eight arcminutes, I would have patched up my hypothesis accordingly. But since it was not permissible to ignore them, those eight arcminutes point the road to a complete reformation of astronomy.”

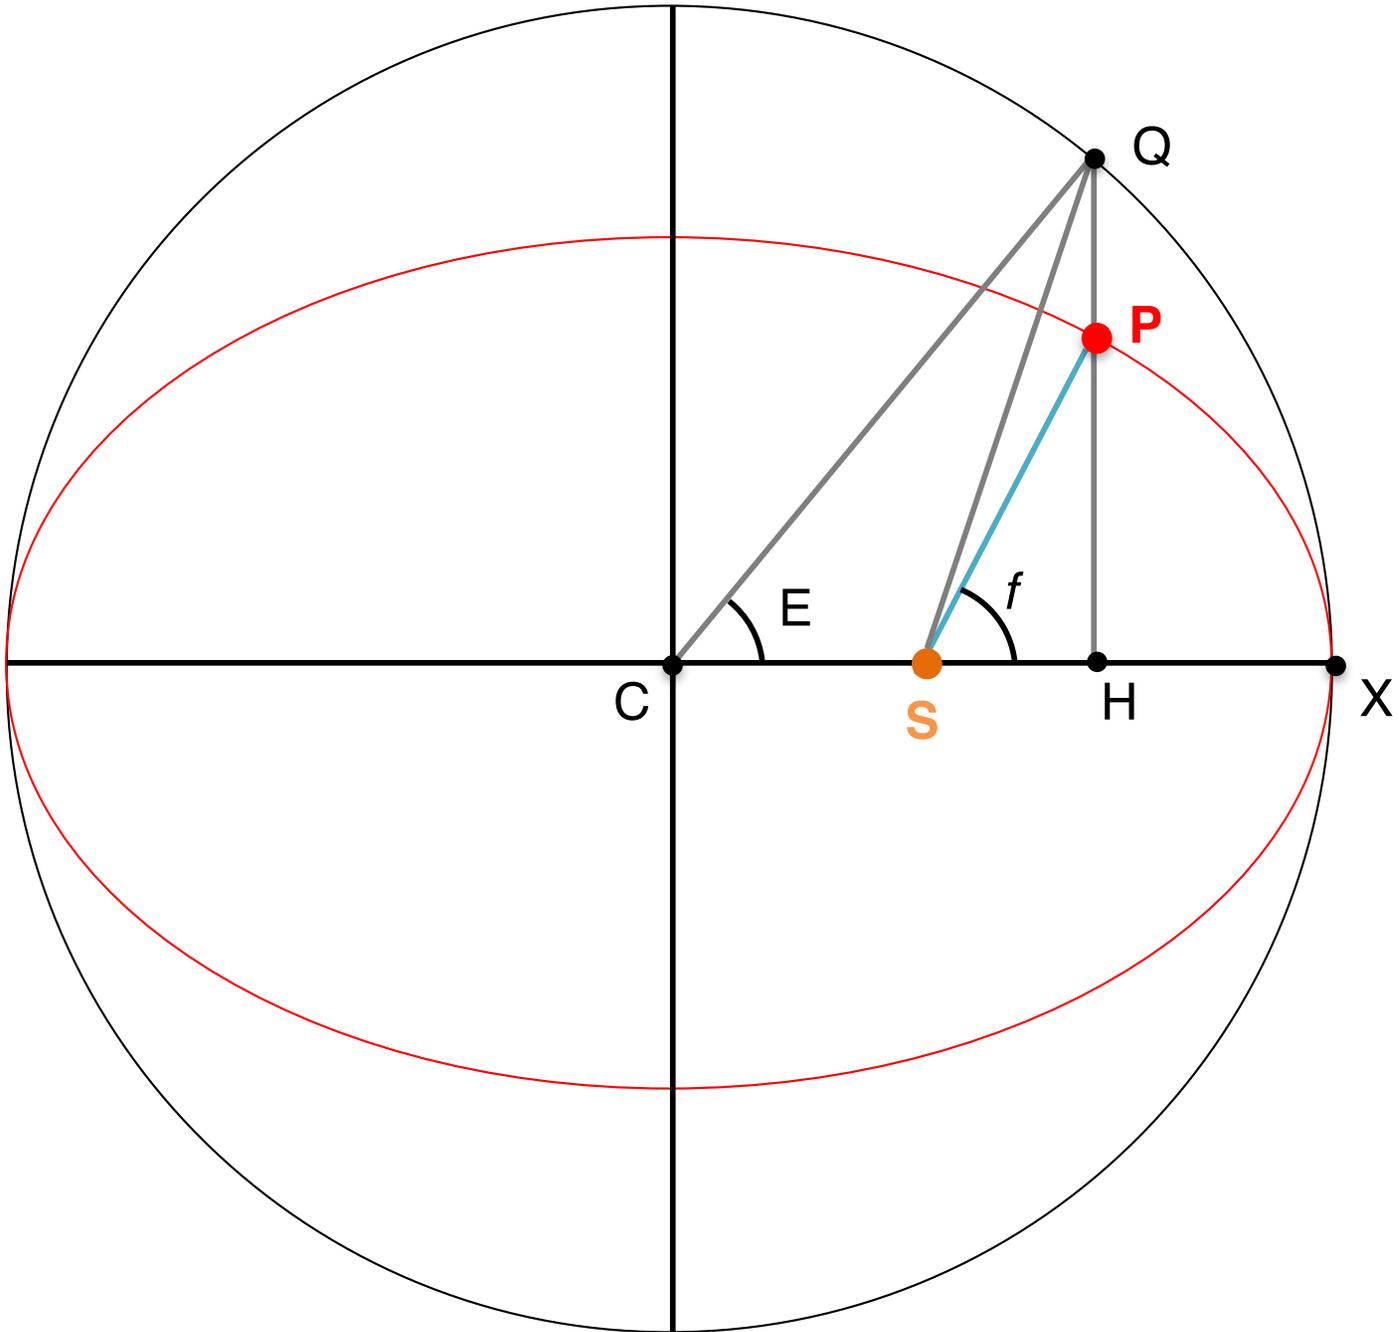

Kepler, Johannes, *Astronomia Nova*, 1609

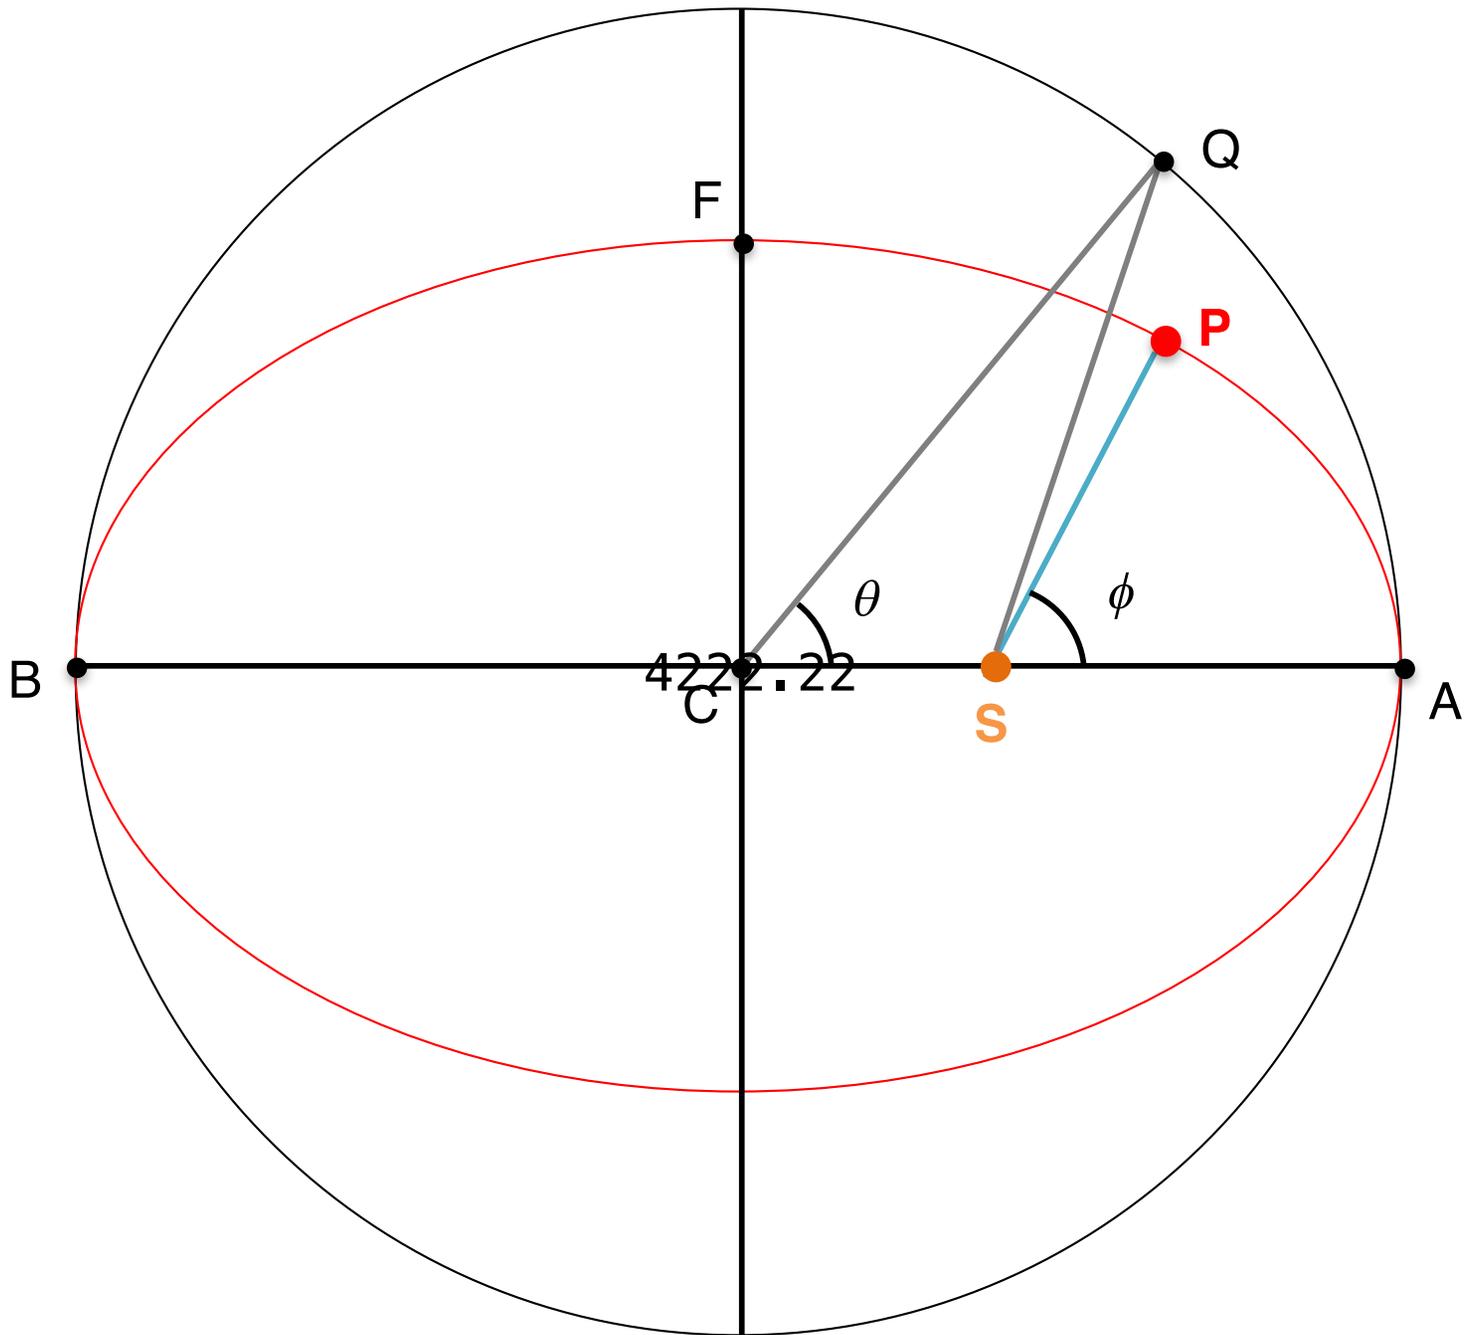

Eccentric anomaly and True anomaly

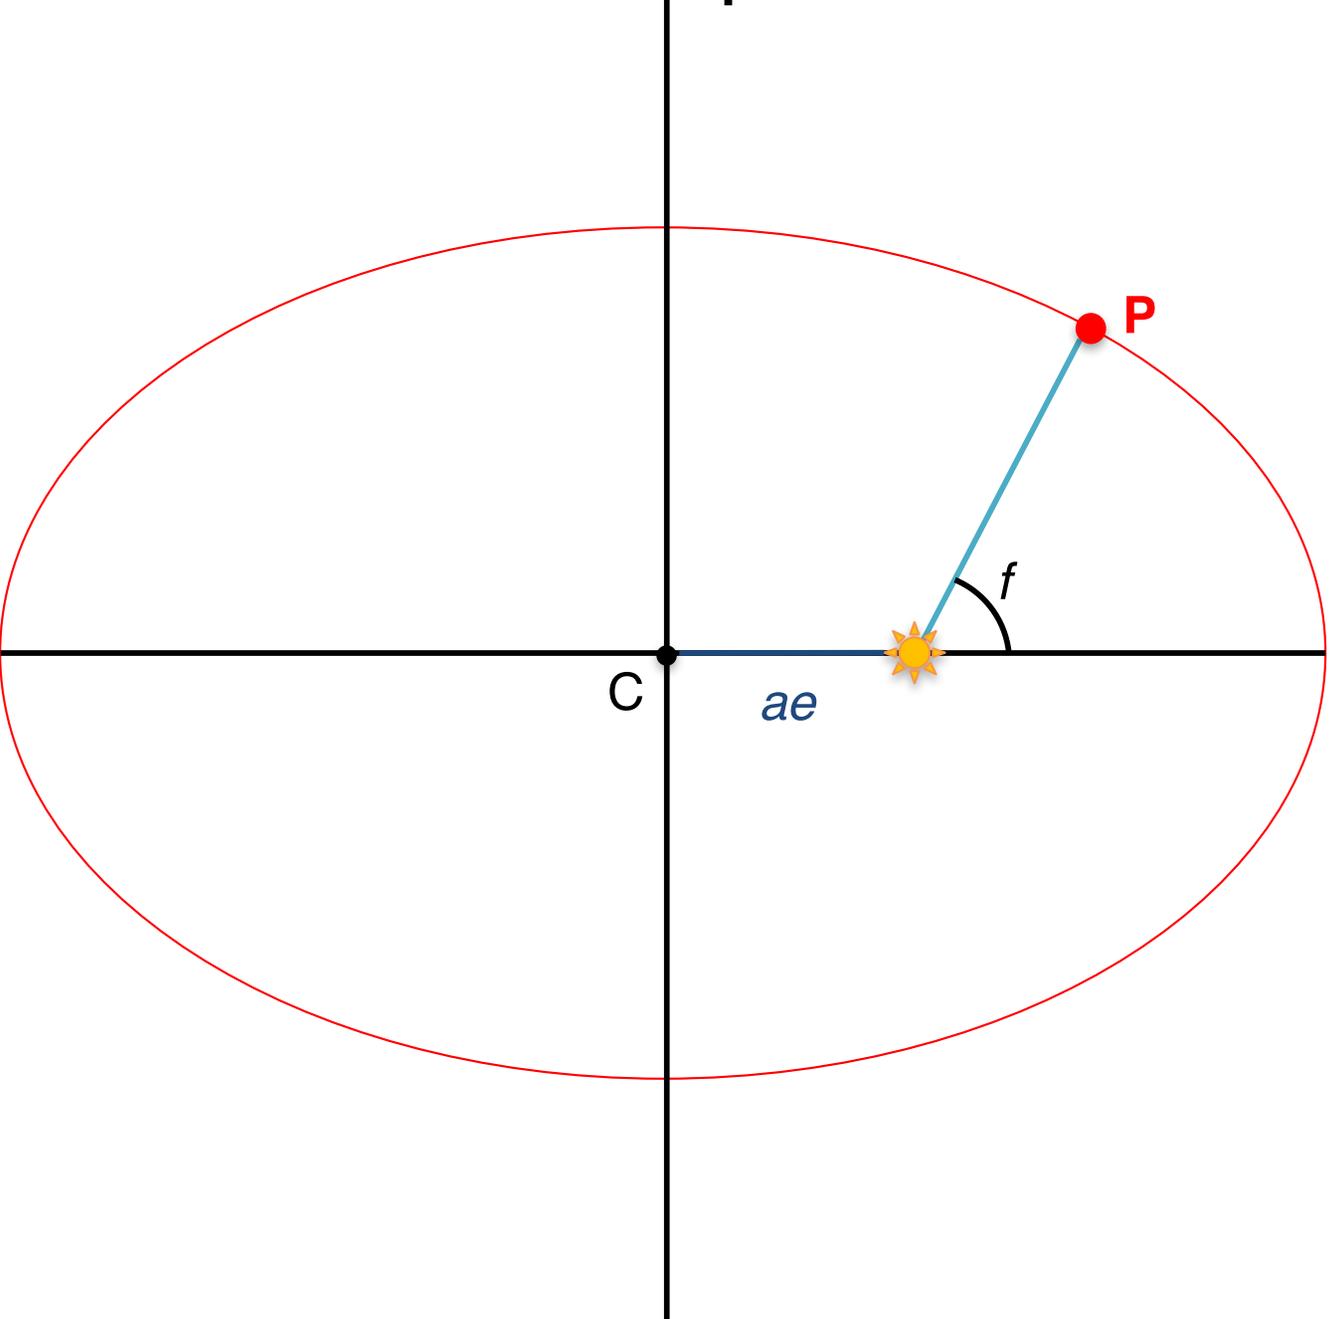

“If this wearisome method has filled you with loathing, it should more properly fill you with compassion for me as I have gone through it at least seventy times at the expense of a great deal of time.”

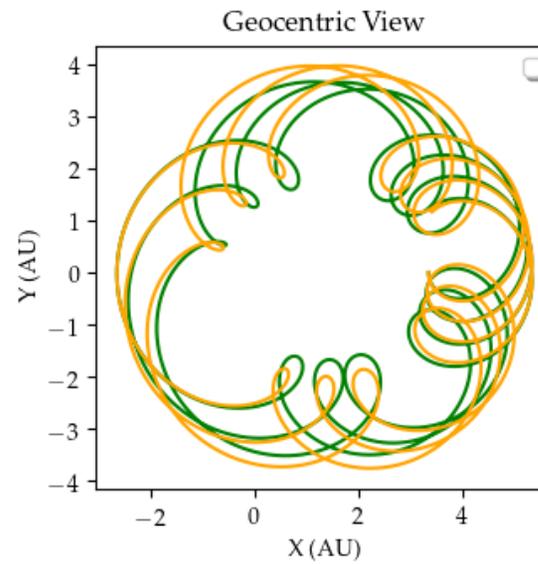

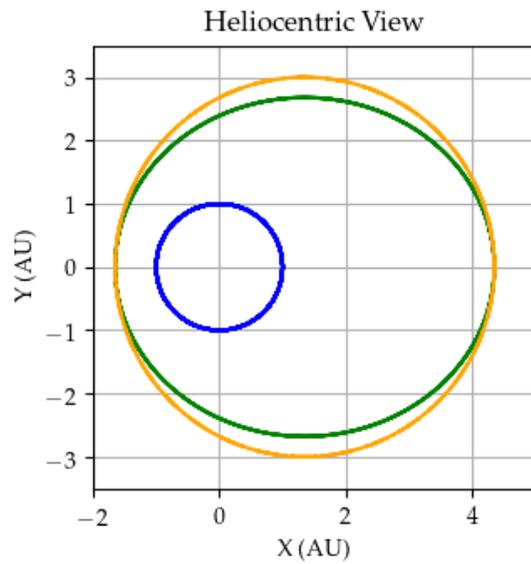

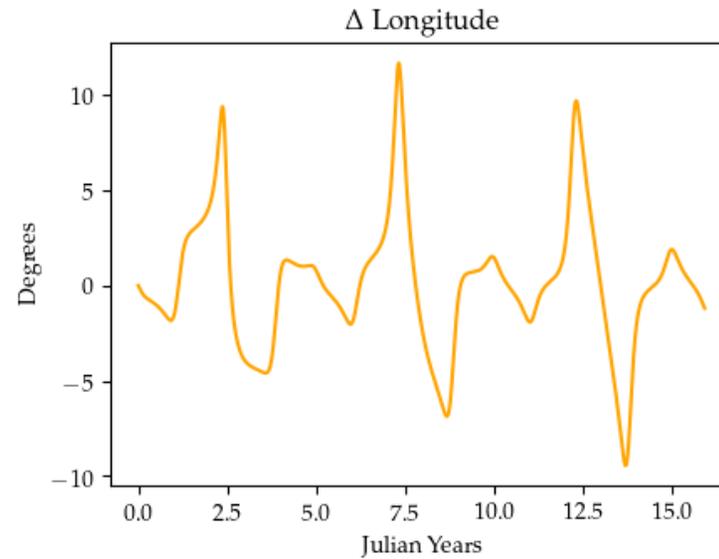

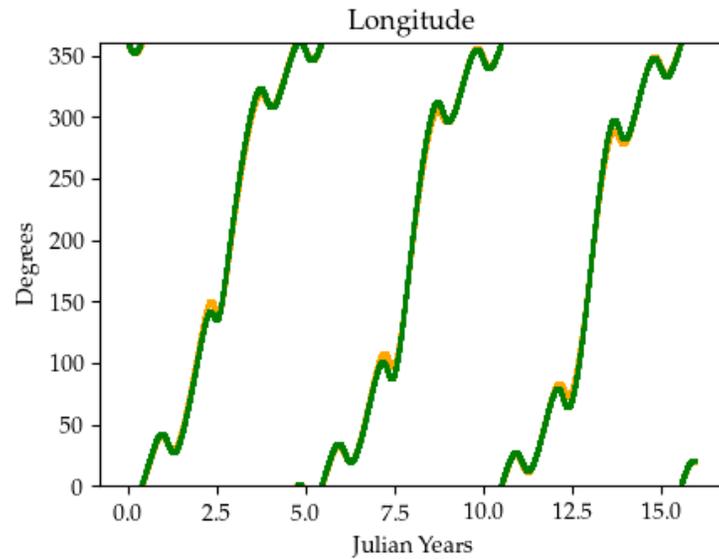

Kepler, Johannes, *Astronomia Nova*, 1609
